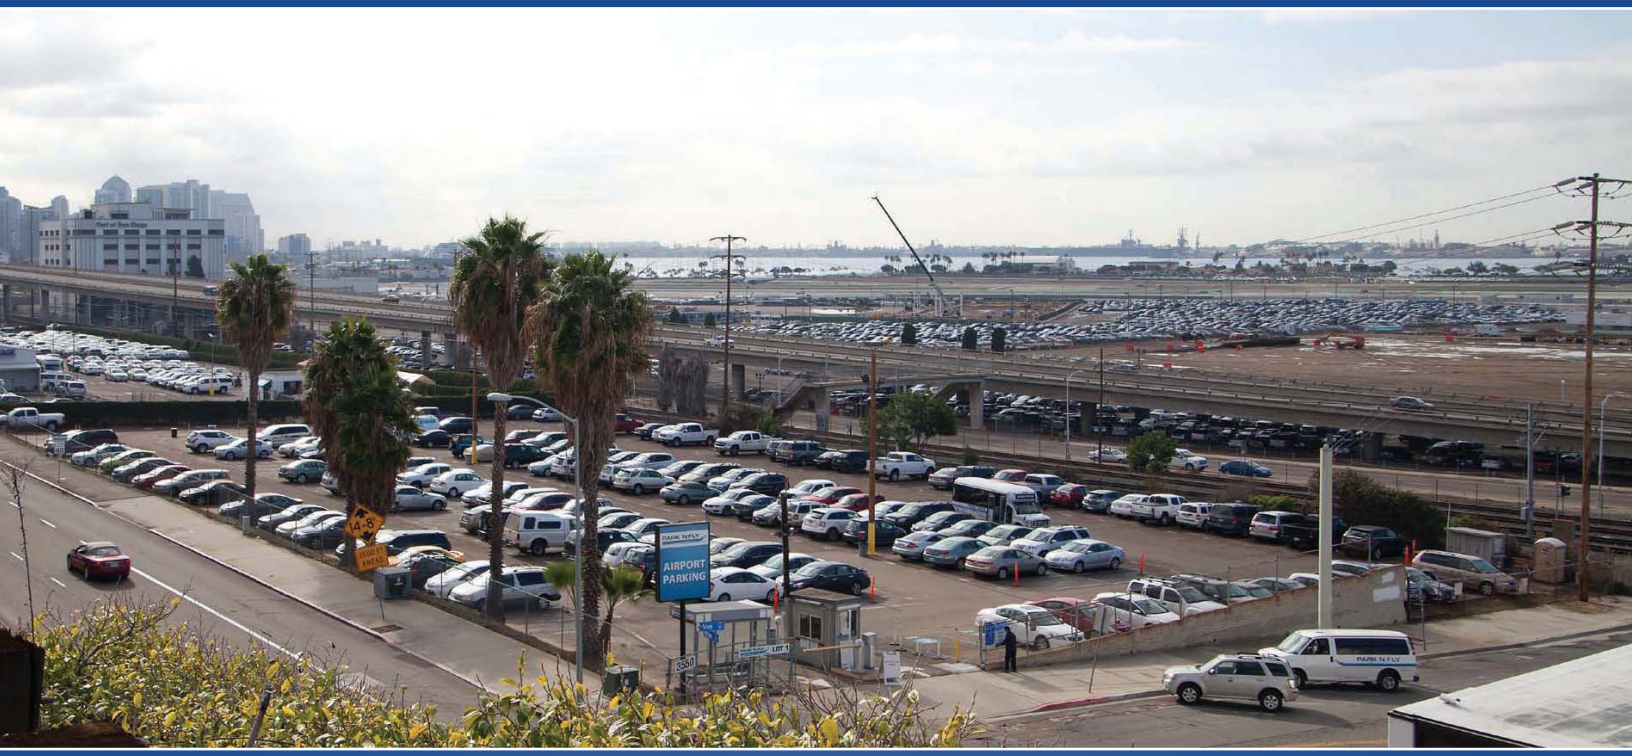
PROPONENT'S ENVIRONMENTAL ASSESSMENT

for the

Vine 69/12 kV Substation Project

Volume II
Application 14-05-___



May 2014

SDGE
A Sempra Energy utility

TABLE OF CONTENTS

CHAPTER 1 – PEA SUMMARY 1-1
1.0 PROJECT COMPONENTS 1-1
1.1 PROJECT LOCATION 1-1
1.2 PROJECT NEED AND ALTERNATIVES 1-1
1.3 AGENCY COORDINATION 1-2
1.3.0 City of San Diego 1-2
1.3.1 San Diego Metropolitan Transit System 1-2
1.3.2 Native American Heritage Commission 1-2
1.4 PROPONENT'S ENVIRONMENTAL ASSESSMENT CONTENTS 1-2
1.5 PEA CONCLUSIONS 1-4
1.6 ISSUES TO BE RESOLVED 1-4
1.7 PUBLIC OUTREACH EFFORTS 1-5

CHAPTER 2 – PROJECT PURPOSE AND NEED 2-1
2.0 OVERVIEW 2-1
2.1 PROJECT OBJECTIVES 2-2
2.1.0 Objective 1: Maintain Existing Reliability Standards for the Distribution and Substation Systems 2-2
2.1.1 Objective 2: Provide Improved Substation and Circuit Reliability with Added Tie Capacity 2-3
2.1.2 Objective 3: Meet the Area Electric Capacity Needs 2-3
2.1.3 Objective 4: Utilize Existing SDG&E-owned Land Previously Purchased for Substation Use to Meet the Scheduled In-service Date 2-3
2.2 CONCLUSION 2-3
2.3 REFERENCES 2-3

CHAPTER 3 – PROJECT DESCRIPTION 3-1
3.0 PROJECT LOCATION 3-1
3.0.0 Proposed Vine 69/12 kV Substation 3-1
3.0.1 12 kV Distribution Relocation 3-1
3.0.2 69 kV Loop-In 3-7
3.0.3 Telecommunication System Extension 3-7
3.1 EXISTING SYSTEM 3-8
3.2 PROJECT OBJECTIVES 3-8
3.3 PROJECT CAPACITY 3-13
3.4 PROPOSED PROJECT 3-13
3.4.0 Proposed Vine 69/12 kV Substation 3-13
3.4.1 12 kV Distribution Relocation 3-19
3.4.2 69 kV Loop-In 3-20
3.4.3 Telecommunication System Extension 3-39
3.5 RIGHT-OF-WAY REQUIREMENTS 3-39
3.6 CONSTRUCTION 3-40
3.6.0 Staging Areas 3-40
3.6.1 Work Areas 3-40
3.6.2 Access 3-48

3.6.3 Methods 3-48
3.6.4 Construction Equipment and Personnel 3-59
3.6.5 Construction Schedule 3-59
3.7 OPERATION AND MAINTENANCE 3-59
3.7.0 Proposed Vine 69/12 kV Substation 3-59
3.7.1 12 kV Distribution Relocation 3-70
3.7.2 69 kV Loop-In 3-70
3.7.3 Telecommunication System Extension 3-70
3.8 ANTICIPATED PERMITS AND APPROVALS 3-71
3.9 PROJECT DESIGN FEATURES AND ORDINARY CONSTRUCTION/OPERATING RESTRICTIONS 3-71
3.10 APPLICANT-PROPOSED MEASURES 3-76
3.10.0 Implementation of Applicant-Proposed Measures 3-76

CHAPTER 4 – ENVIRONMENTAL IMPACT ASSESSMENT SUMMARY 4-1

LIST OF TABLES

Table 1-1: PEA Checklist Key 1-6

CHAPTER 1 – PEA SUMMARY

Consistent with California Public Utilities Commission (CPUC) General Order 131-D, this Proponent's Environmental Assessment (PEA) has been prepared by San Diego Gas & Electric Company (SDG&E) to support SDG&E's application for a Permit to Construct the Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project).

1.0 PROJECT COMPONENTS

The Proposed Project involves the construction of a new 69/12 kV substation—Vine Substation. The Proposed Project will also involve the relocation of eight 12 kV distribution circuits, the looping in of an existing 69 kV power line to the Vine Substation, and the extension of an existing telecommunication system.

1.1 PROJECT LOCATION

The Proposed Project site is located within the City of San Diego, California. The proposed Vine Substation, which is the primary component of the Proposed Project, is situated approximately two miles northwest of downtown San Diego, directly adjacent to and east of the San Diego International Airport (also known as Lindbergh Field). The location of the Proposed Project is depicted in Figure 3-1: Project Location Map. The four Proposed Project components are depicted in Figure 3-2: Project Overview Map and described in more detail in Chapter 3 – Project Description.

1.2 PROJECT NEED AND ALTERNATIVES

As described further in Chapter 2 – Project Purpose and Need, the Proposed Project is being proposed to meet the following four objectives:

- Objective 1: Maintain existing substation and distribution system reliability standards.
- Objective 2: Provide substation and circuit tie capacity that will provide additional reliability for existing and future system needs.
- Objective 3: Meet the area's long-term electric distribution capacity needs by constructing a substation near planned load growth.
- Objective 4: Utilize existing SDG&E-owned land previously purchased for substation use to meet the scheduled in-service date.

Various substation site alternatives and existing system alternatives were considered during the development of the Proposed Project. The Proposed Project was ultimately selected because it best meets all of the Proposed Project objectives and is the most cost effective when compared to all alternatives.

1.3 AGENCY COORDINATION

1.3.0 City of San Diego

SDG&E provided an overview of the Proposed Project to the City of San Diego Development Services Office, San Diego Planning Groups, San Diego City Public Utilities Department, and the San Diego City Council. Continuing outreach, including meet and confer meetings will continue to occur upon the request of City personnel.

1.3.1 San Diego Metropolitan Transit System

SDG&E provided an overview of the Proposed Project to the San Diego Metropolitan Transit System (MTS) and will continue to work with MTS to obtain all necessary permits required.

1.3.2 Native American Heritage Commission

The Native American Heritage Commission (NAHC) was contacted by ASM Affiliates on December 13, 2013 for a Sacred Lands Record Search and for a list of the appropriate Native American representatives to contact for input on the Proposed Project. The response from the NAHC on December 19, 2013 indicated that no Native American traditional cultural places had been submitted for the Proposed Project area. However, the NAHC provided a list of local Native American contacts that may be knowledgeable about cultural resources within or near the Proposed Project area. Letters were sent on December 20, 2013 to these representatives, and copies of the letters are included in Attachment 4.5-A: NAHC Correspondence. No replies have been received to date.

1.4 PROPONENT'S ENVIRONMENTAL ASSESSMENT CONTENTS

This PEA was prepared in accordance with the PEA Checklist issued by the CPUC on November 24, 2008, and is divided into the following five sections:

- Chapter 1 – PEA Summary discusses the contents and conclusions of the PEA and describes SDG&E's ongoing and past coordination efforts.

- Chapter 2 – Project Purpose and Need outlines the Proposed Project's four objectives, which have been discussed previously.

- Chapter 3 – Project Description provides a detailed description of the Proposed Project. This discussion includes specifics regarding the following:

    - Proposed Project location
    - The existing system
    - Proposed Project components
    - Permanent and temporary land/right-of-way (ROW) requirements
    - Construction methods
    - Construction schedule
    - Anticipated operation and maintenance activities
    - Federal and local permits that will be obtained for the Proposed Project

  - Summary of all of the applicant-proposed measures (APMs) to be implemented as part of the Proposed Project, as well as justification for each

- Chapter 4 – Environmental Impact Assessment includes an environmental impact assessment summary and a discussion of the existing conditions and potential and anticipated impacts of the Proposed Project for each of the following resource areas:

  - Aesthetics
  - Agriculture and Forestry Resources
  - Air Quality
  - Biological Resources
  - Cultural Resources
  - Geology and Soils
  - Greenhouse Gas (GHG) Emissions
  - Hazards and Hazardous Materials
  - Hydrology and Water Quality
  - Land Use and Planning
  - Mineral Resources
  - Noise
  - Population and Housing
  - Public Services
  - Recreation
  - Transportation and Traffic
  - Utilities and Service Systems

  The CPUC's PEA Checklist indicates that the environmental setting section can be provided separately or combined with the impacts and APMs. SDG&E has elected to combine the existing conditions, impacts, and APMs for each resource area in Chapter 4 – Environmental Impact Assessment. This chapter also includes a Cumulative Analysis, which discusses past, present, and reasonably foreseeable future projects within the Proposed Project area, as well as the Proposed Project's potential to contribute to a significant cumulative effect.

- Chapter 5 – Detailed Discussion of Significant Impacts identifies that there are no potentialy significant impacts that will result from the Proposed Project, evaluates alternatives to the Proposed Project, describes the justification for the preferred alternative, and discusses the Proposed Project's potential to induce growth in the area.

Throughout the PEA, SDG&E addresses all items requested in the CPUC's PEA Checklist. To facilitate confirmation of this and review of the PEA, Table 1-1: PEA Checklist Key has been included at the end of this chapter and identifies the sections in which each checklist item is addressed.

1.5 PEA CONCLUSIONS

The PEA analyzes the potential environmental impacts associated with construction, operation, and maintenance of the Proposed Project. The following 15 resource areas will not be impacted by the Proposed Project or will experience less-than-significant impacts:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Hydrology and Water Quality
- Geology and Soils
- GHG Emissions
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation and Traffic
- Utilities and Service Systems

Although the Proposed Project will result in potentially significant impacts to the two remaining resource areas, these impacts will be reduced to a less-than-significant level with the implementation of APMs. These impacts are summarized as follows:

- Cultural Resources – Potential for discovery and damage to unknown cultural resources resulting from grading and excavation activities

- Hazards and Hazardous Materials – Temporary and permanent impacts associated with the transport and use of hazardous materials, as well as the potential release of hazardous materials resulting from the operation of the proposed Vine Substation

APMs will be implemented to reduce impacts to a less-than-significant level and are discussed in detail in their relevant sections. The APMs have been identified by applicability to each Proposed Project component and described in Table 3-8: Applicant-Proposed Measures in Chapter 3 – Project Description. A summary and the justification for each APM are also provided in Table 3-8: Applicant-Proposed Measures in Chapter 3 – Project Description.

1.6 ISSUES TO BE RESOLVED

There are no existing issues that require resolution.

1.7 PUBLIC OUTREACH EFFORTS

A proactive approach to community engagement and collaboration has helped SDG&E identify issues early in the process, which will result in fewer, if any, disruptions to local communities and property owners than if no outreach had occurred. Throughout the approval process, SDG&E will continue to inform area residents and property owners, government officials, Native American tribes, and interested parties about the scope of the Proposed Project through its website, printed materials, one-on-one meetings, and presentations to local organizations. A toll-free phone number and dedicated e-mail address will also be established to allow residents and property owners to make direct contact with the Proposed Project team.

During construction, SDG&E will work to minimize disruptions from construction traffic, and limit dust and noise. SDG&E will establish a community outreach program to continuously communicate with government agencies—including the CPUC, City of San Diego, local Native American tribes, and other government officials—regarding construction impacts. Additional activities will be implemented to keep property owners and the public informed of construction activities to minimize disruptions and address any concerns that arise.

Personalized contacts and the latest technology will be utilized to allow communication with the public and affected stakeholders when necessary. SDG&E will strive to ensure that the local community and property owners receive information to minimize disruptions to their daily lives. Furthermore, efforts to keep all affected agencies and interested parties informed will be pursued.

Table 1-1: PEA Checklist Key

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
Chapter 1 – PEA Summary		
	Include major conclusions of the PEA.	Section 1.5 PEA Conclusions
	List any areas of controversy.	Section 1.6 Issues to be Resolved
	Include a description of inter-agency coordination, if any.	Section 1.3 Agency Coordination
	Include a description of public outreach efforts, if any.	Section 1.7 Public Outreach Efforts
	Identify any major issues that must be resolved, including the choice among reasonably feasible alternatives and mitigation measures, if any.	Section 1.5 PEA Conclusions
Chapter 2 – Project Purpose and Need		
2.1 Overview	Include an analysis of Proposed Project objectives and purpose and need that is sufficiently detailed so that the Commission can independently evaluate the Proposed Project need and benefits in order to accurately consider them in light of the potential environmental impacts.	Section 2.0 Overview Section 2.1 Project Objectives
	Explain the objective(s) and/or purpose and need for implementing the Proposed Project.	Section 2.0 Overview Section 2.1 Project Objectives
2.2 Project Objectives	Include an analysis of the reason why attainment of these objectives is necessary or desirable. Such analysis must be sufficiently detailed to inform the Commission in its independent formulation of Proposed Project objectives which will aid any appropriate California Environmental Quality Act alternatives screening process.	Section 2.1 Project Objectives

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
Chapter 3 – Project Description		
3.1 Project Location	Identify geographical location: County, City (provide Proposed Project location map[s]).	Section 3.0 Project Location Figure 3-1: Project Location Map Attachment 3-A: Detailed Project Components Map
	Provide a general description of land uses within the Proposed Project site (e.g., residential, commercial, agricultural, recreation, vineyards, farms, open space, number of stream crossings, etc.).	Section 3.0 Project Location Table 4.10-1: Existing and Designated Land Uses
	Describe if the Proposed Project is located within an existing property owned by the Applicant, traverses existing rights-of-way (ROW), or requires new ROW. Provide the approximate area of the property or the length of the Proposed Project that is in an existing ROW or which requires new ROWs.	Section 3.0 Project Location Section 3.4 Project Components Section 3.5 Right-of-Way Requirements
3.2 Existing System	Describe the local system to which the Proposed Project relates. Include all relevant information about substations, transmission lines, and distribution circuits.	Section 3.1 Existing System
	Provide a schematic diagram and map of the existing system.	Figure 3-3: Existing System Configuration
	Provide a schematic diagram that illustrates the system as it would be configured with the implementation of the Proposed Project.	Figure 3-4: Proposed System Configuration
3.4 Proposed Project	Describe the whole of the Proposed Project. Is it an upgrade, a new line, new substations, etc.?	Section 3.0 Project Location Section 3.4 Project Components
	Describe how the Proposed Project fits into the regional system. Does it create a loop for reliability, etc.?	Section 3.1 Existing System Section 3.2 Project Objectives
	Describe all reasonably foreseeable future phases or other reasonably foreseeable consequences of the Proposed Project.	Section 3.4 Project Components

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.4 Proposed Project (cont.)	Provide the capacity increase in megawatts (MW). If the Proposed Project does not increase capacity, state that.	Chapter 2 – Project Purpose and Need Section 3.3 Project Capacity
	Provide geographic information system (GIS) (or equivalent) data layers for the Proposed Project preliminary engineering, including estimated locations of all physical components of the Proposed Project, as well as those related to construction.	A CD containing the relevant GIS data for the Proposed Project has been submitted under separate cover as part of this PEA package.
3.5 Project Components **3.5.1 Transmission Line**	Describe what type of line exists and what type of line is proposed (e.g., single-circuit, double-circuit, upgrade 69 kV to 115 kV).	Section 3.4 Project Components
	Identify the length of the upgraded alignment, the new alignment, etc.	Section 3.4 Project Components
	Describe whether construction would require one-for-one pole replacement, new poles, steel poles, etc.?	Section 3.4 Project Components
	Describe what would occur to other lines and utilities that may be collocated on the poles to be replaced (e.g., distribution, communication, etc.).	Section 3.4 Project Components
3.5.2 Poles/Towers	Provide information for each pole/tower that would be installed and for each pole/tower that would be removed.	Section 3.0.2 69 kV Loop-In Section 3.4 Project Components Attachment 3-A: Detailed Project Components Map
	Provide a unique identification number to match GIS database information.	A CD containing the relevant GIS data, which includes unique identification numbers for poles, has been submitted under separate cover as part of this PEA package.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.5.2 Poles/Towers (cont.)	Provide a structural diagram and, if available, photos of existing structure. Preliminary diagram or "typical" drawings and, if possible, photos of proposed structure. Also provide a written description of the most common types of structures and their use (e.g., tangent poles would be used when the run of poles continues in a straight line, etc.). Describe if the pole/tower design meets raptor safety requirements.	Section 3.4 Project Components Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole Section 4.4.3 Impacts
	Provide the type of pole (e.g., wood, steel, etc.) or tower (e.g., self-supporting, lattice, etc.).	Section 3.4 Project Components Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole
	Identify typical total pole lengths, the approximate length to be embedded, and the approximate length that would be above ground surface; for towers, identify the approximate height above ground surface and approximate base footprint area.	Section 3.4 Project Components Section 3.6.3 Methods Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole
	Describe any specialty poles or towers; note where they would be used (e.g., angle structures, heavy angle lattice towers, stub guys, etc.); make sure to note if any guying would likely be required across a road.	Section 3.4 Project Components Section 3.6.3 Methods Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.5.2 Poles/Towers (cont.)	If the Proposed Project includes pole-for-pole replacement, describe the approximate location of where the new poles would be installed relative to the existing alignment.	Section 3.4 Project Components
	Describe any special pole types (e.g., poles that require foundations, transition towers, switch towers, microwave towers, etc.) and any special features.	Section 3.4 Project Components Section 3.6.3 Methods Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole
3.5.3 Conductor/Cable **3.5.3.1 Above-Ground Installation**	Describe the type of line to be installed on the poles/tower (e.g. single-circuit with distribution, double circuit, etc.).	Section 3.4 Project Components
	Describe the number of conductors required to be installed on the poles or tower and the number on each side including applicable engineering design standards.	Section 3.4 Project Components
	Provide the size and type of conductor (e.g., aluminum conductor, steel reinforced, non-specular, etc.) and insulator configuration.	Section 3.4 Project Components Section 3.6.3 Methods
	Provide the approximate distance from the ground to the lowest conductor and the approximate distance between the conductors (i.e., both horizontally and vertically). Provide specific information at highways, rivers, or special crossings.	Section 3.4 Project Components
	Provide the approximate span lengths between poles or towers, note where different if distribution is present or not if relevant.	Section 3.4 Project Components
	Determine whether other infrastructure would likely be collocated with the conductor (e.g., fiber optics, etc.); if so, provide conduit diameter of other infrastructure.	Section 3.4 Project Components

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.5.3.2 Below Ground Installation	Describe the type of line to be installed (e.g., single circuit cross-linked polyethylene-insulated solid-dielectric, copper-conductor cables).	Section 3.4 Project Components
	Describe the type of casing the cable would be installed in (e.g., concrete-encased duct bank system); provide the dimensions of the casing.	Section 3.4 Project Components Section 3.6.3 Methods Figure 3-8: Typical 12 kV Underground Duct Bank Figure 3-9: Typical 12 kV Underground Vault
	Provide an engineering 'typical' drawing of the duct bank and describe what types of infrastructure would likely be installed within the duct bank (e.g., transmission, fiber optics, etc.).	Figure 3-8: Typical 12 kV Underground Duct Bank Figure 3-9: Typical 12 kV Underground Vault
3.5.4 Substations	Provide "typical" plan and profile views of the proposed substation and the existing substation if applicable.	Figure 3-5: Vine Substation Initial Arrangement Figure 3-6: Vine Substation Ultimate Arrangement Figure 3-7: Vine Substation Profile View
	Describe the types of equipment that would be temporarily or permanently installed and provide details as to what the function/use of said equipment would be. Include information such as, but not limited to: mobile substations, transformers, capacitors, and new lighting.	Section 3.4 Project Components Figure 3-5: Vine Substation Initial Arrangement Figure 3-6: Vine Substation Ultimate Arrangement
	Provide the approximate or "typical" dimensions (width and height) of new structures including engineering and design standards that apply.	Section 3.4 Project Components Section 3.6.3 Methods Figure 3-5: Vine Substation Initial Arrangement Figure 3-6: Vine Substation Ultimate Arrangement Figure 3-7: Vine Substation Profile View

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.5.4 Substations (cont.)	Describe the extent of the Proposed Project. Would it occur within the existing fence line, existing property line or would either need to be expanded?	Section 3.0 Project Location Section 3.4 Project Components Section 3.5 Right-of-Way Requirements
	Describe the electrical need area served by the distribution substation.	Chapter 2 – Project Purpose and Need Section 3.2 Project Objectives
3.6 Right-of-Way Requirements	Describe the ROW location, ownership, and width. Would the existing ROW be used or would new ROW be required?	Section 3.5 Right-of-Way Requirements
	If a new ROW is required, describe how it would be acquired and approximately how much land would be required (length and width).	Section 3.5 Right-of-Way Requirements
	List the properties likely to require acquisition.	Section 3.5 Right-of-Way Requirements
3.7 Construction **3.7.1 For All Projects** **3.7.1.1 Staging Areas**	Where would the main staging area(s) likely be located?	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas Attachment 3-A: Detailed Project Components Map
	Approximately how large would the main staging area(s) be?	Section 3.6.0 Staging Areas
	Describe any site preparation required, if known, or generally describe what might be required (i.e., vegetation removal, new access road, installation of rock base, etc.).	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas
	Describe what the staging area would be used for (i.e., material and equipment storage, field office, reporting location for workers, parking area for vehicles and equipment, etc.).	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas
	Describe how the staging area would be secured; would a fence be installed? If so, describe the type and extent of the fencing.	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7 Construction **3.7.1 For All Projects** **3.7.1.1 Staging Areas (cont.)**	Describe how power to the site would be provided if required (i.e., tap into existing distribution, use of diesel generators, etc.).	Section 3.6.0 Staging Areas
	Describe any grading activities and/or slope stabilization issues.	Section 3.6.3 Methods
3.7.1.2 Work Areas	Describe known work areas that may be required for specific construction activities (i.e., pole assembly, hill side construction, etc.).	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas
	For each known work area, provide the area required (include length and width) and describe the types of activities that would be performed.	Section 3.6.0 Staging Areas Section 3.6.1 Work Areas Table 3-2: Temporary Workspace Requirements
	Identify the approximate location of known work areas in the GIS database.	Attachment 3-A: Detailed Project Components Map A CD containing the relevant GIS data for the work areas has been submitted under separate cover as part of this PEA package.
	Describe how the work areas would likely be accessed (e.g., construction vehicles, walk-in, helicopter, etc.).	Section 3.6.1 Work Areas Section 3.6.2 Access
	If any site preparation is likely required, generally describe what and how it would be accomplished.	Section 3.6.3 Methods
	Describe any grading activities and/or slope stabilization issues.	Section 3.6.3 Methods
	Based on the information provided, describe how the site would be restored.	Section 3.6.3 Methods

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.1.3 Access Roads and/or Spur Roads	Describe the types of roads that would be used and/or would need to be created to implement the Proposed Project. Road types may include, but are not limited to: new permanent road; new temporary road; existing road that would have permanent improvements; existing road that would have temporary improvements; existing paved road; existing dirt/gravel road; and overland access.	Section 3.6.2 Access
	For road types that require preparation, describe the methods and equipment that would be used.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements
	Identify approximate location of all access roads (by type) in the GIS database.	A CD containing the relevant GIS data for the Proposed Project has been submitted under separate cover as part of this PEA package.
	Describe any grading activities and/or slope stabilization issues.	Section 3.6.3 Methods
3.7.1.4 Helicopter Access	Identify which proposed poles/towers would be removed and/or installed using a helicopter.	Helicopter use is not proposed.
	If different types of helicopters are to be used, describe each type (e.g., light, heavy, or sky crane) and what activities they would be used for.	Helicopter use is not proposed.
	Provide information as to where the helicopters would be staged, where they would refuel, and where they would land within the Proposed Project site.	Helicopter use is not proposed.
	Describe any Best Management Practices (BMPs) that would be employed to avoid impacts caused by use of helicopters, for example: air quality and noise considerations.	Helicopter use is not proposed.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.1.4 Helicopter Access (cont.)	Describe flight paths, payloads, hours of operations for known locations, and work types.	Helicopter use is not proposed.
3.7.1.5 Vegetation Clearance	Describe the types of vegetation clearing that may be required (e.g., tree removal, brush removal, flammable fuels removal) and why (e.g., to provide access, etc.).	Section 3.6.1 Work Areas Section 3.6.3 Methods
	Identify the preliminary location and provide an approximate area of disturbance in the GIS database for each type of vegetation removal.	Section 3.6.1 Work Areas Section 3.6.3 Methods Section 4.4.3 Impacts A CD containing the relevant GIS data for the Proposed Project has been submitted under separate cover as part of this PEA package.
	Describe how each type of vegetation removal would be accomplished.	Section 3.6.1 Work Areas Section 3.6.3 Methods
	For removal of trees, distinguish between tree trimming as required under GO-95 and tree removal.	3.6.1 Work Areas
	Describe the types and approximate number and size of trees that may need to be removed.	3.6.1 Work Areas.
	Describe the type of equipment typically used.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.1.6 Erosion and Sediment Control and Pollution Prevention during Construction	Describe the areas of soil disturbance including estimated total areas and associated terrain type and slope. List all known permits required. For project sites of less than one acre, outline the BMPs that would be implemented to manage surface runoff. Things to consider include, but are not limited to: Erosion and sedimentation BMPs, vegetation removal and restoration, and/or hazardous waste, and spill prevention plans.	Section 3.9.1 Erosion and Sediment Control and Pollution Prevention During Construction Section 3.6.3 Methods Section 3.8: Anticipated Permits and Approvals Table 3-7: Permit, Approval, and Consultation Requirements Table 3-8: Applicant-Proposed Measures
	Describe any grading activities and/or slope stabilization issues.	Section 3.6.3 Methods
	Describe how construction waste (i.e., refuse, spoils, trash, oil, fuels, poles, pole structures, etc.) would be disposed.	Section 3.9.1 Erosion and Sediment Control and Pollution Prevention During Construction Section 4.17.3 Impacts
3.7.1.7 Cleanup and Post-Construction Restoration	Describe how cleanup and post-construction restoration would be performed (i.e., personnel, equipment, and methods). Things to consider, but are not limited to, restoration of natural drainage patterns, wetlands, vegetation, and other disturbed areas (i.e., staging areas, access roads, etc.).	Section 3.6.3 Methods
3.7.2 Transmission Line Construction (Above Ground) **3.7.2.1 Pull and Tension Sites**	Provide the general or average distance between pull and tension sites.	Section 3.6.1 Work Areas Section 3.6.3 Methods Attachment 3-A: Detailed Project Components Map
	Provide the area of pull and tension sites including the estimated length and width.	Section 3.6.1 Work Areas Section 3.6.3 Methods

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.2 Transmission Line Construction (Above Ground) **3.7.2.1 Pull and Tension Sites (cont.)**	According to the preliminary plan, identify the number of pull and tension sites that would be required, and their locations. Provide the location information in GIS.	Section 3.6.1 Work Areas Section 3.6.3 Methods Attachment 3-A: Detailed Project Components Map A CD containing the relevant GIS data for the Proposed Project has been submitted under separate cover as part of this PEA package.
	Describe the type of equipment that would be required at these sites.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements
	If conductor is being replaced, describe how it would be removed from the site.	Section 3.6.3 Methods
3.7.2.2 Pole Installation and Removal	Describe how the construction crews and their equipment would be transported to and from the pole site locations. Provide vehicle type, number of vehicles, estimated number of trips, and hours of operation.	Section 3.6.2 Access Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements
	Describe the process of removing the poles and foundations.	Section 3.6.3 Methods
	Describe what happens to the holes that the poles were in (i.e., reused or backfilled)?	Section 3.6.3 Methods
	If the holes are to be backfilled, what type of fill would be used and where would it come from?	Section 3.6.3 Methods
	Describe any surface restoration that would occur at the pole sites.	Section 3.6.3 Methods
	Describe how the poles would be removed from the sites.	Section 3.6.3 Methods

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.2.2 Pole Installation and Removal (cont.)	If topping is required to remove a portion of an existing transmission pole that would now only carry distribution lines, describe the methodology to access and remove the tops of these poles. Describe any special methods that would be required to top poles that may be difficult to access, etc.	Pole topping is not proposed.
	Describe the process of how the new poles/towers would be installed; specifically identify any special construction methods (e.g., helicopter installation) for specific locations or for different types of poles/towers.	Section 3.6.3 Methods
	Describe the types of equipment and their use as related to pole/tower installation.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements
	Describe the actions taken to maintain a safe work environment during construction (e.g., covering of holes/excavation pits, etc.).	Section 3.4 Project Components Section 3.6.2 Access Section 3.6.3 Methods
	Describe what would be done with soil that is removed from a hole/foundation site.	Section 3.6.3 Methods
	For any foundations required, provide a description of the construction method(s), approximate average depth and diameter of excavation, approximate volume of soil to be excavated, approximate volume of concrete or other backfill required, etc.	Section 3.6.3 Methods
	Describe briefly how poles/towers and associated hardware are assembled.	Section 3.6.3 Methods
	Describe how the poles/towers and associated hardware would be delivered to the site; would they be assembled off-site and brought in or assembled on site?	Section 3.6.3 Methods

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.2.2 Pole Installation and Removal (cont.)	Provide the following information about pole/tower installation and associated disturbance area estimates; pole diameter for each pole type (e.g., wood, self-supporting steel, lattice, etc.), base dimensions for each pole type, auger hole depth for each pole type, permanent footprint per pole/tower, number of poles/towers by pole type, average work area around poles/towers by pole type (e.g., for old pole removal and new pole installation), and total permanent footprint for poles/towers.	Section 3.6.1 Work Areas Section 3.6.3 Methods Figure 3-13: Typical Existing 69 kV Wood Pole Figure 3-14: Typical Existing Stub Guy Pole Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole Table 3-2: Temporary Workspace Requirements
3.7.2.3 Conductor/Cable Installation	Provide a process-based description of how new conductor/cable would be installed and how old conductor/cable would be removed, if applicable.	Section 3.6.3 Methods
	Generally describe the conductor/cable splicing process.	Section 3.6.3 Methods
	If vaults are required, provide their dimensions and approximate location/spacing along the alignment.	Section 3.6.3 Methods
	Describe in what areas conductor/cable stringing/installation activities would occur.	Section 3.6.1 Work Areas Section 3.6.3 Methods Attachment 3-A: Detailed Project Components Map
	Describe any safety precautions or areas where special methodology would be required (e.g., crossing roadways, stream crossing, etc.).	Section 3.6.3 Methods
3.7.3 Transmission Line Construction (Below Ground) **3.7.3.1 Trenching**	Describe the approximate dimensions of the trench (e.g., depth, width).	Section 3.6.3 Methods

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.3 Transmission Line Construction (Below Ground) **3.7.3.1 Trenching (cont.)**	Describe the methodology of making the trench (e.g., saw cutter to cut the pavement, backhoe to remove, etc.).	Section 3.6.3 Methods Figure 3-18: Typical Underground Construction Process within Roadways
	Provide the total approximate cubic yardage of material to be removed from the trench, the amount to be used as backfill and the amount to subsequently be removed/disposed of off-site.	Section 3.6.3 Methods
	Provide off-site disposal location, if known, or describe possible option(s).	Section 3.6.3 Methods
	If engineered fill would be used as backfill, provide information as to the type of engineered backfill and the amount that would be typically used (e.g., top two feet would be filled with thermal-select backfill).	Section 3.6.3 Methods
	Describe if dewatering would be anticipated, if so, how the trench would be dewatered, what the anticipated flows of the water are, whether there would be treatment, and how the water would be disposed.	Section 3.6.3 Methods
	Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants that could be exposed as a result of trenching operations.	Section 3.6.3 Methods
	If pre-existing hazardous waste was encountered, describe the process of removal and disposal.	Section 3.6.3 Methods Section 4.8.3 Impacts
	Describe any standard BMPs that would be implemented.	Section 3.6.3 Methods Section 3.9.2 Erosion and Sediment Control and Pollution Prevention During Construction Table 3-8: Applicant-Proposed Measures

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.3.2 Trenchless Techniques: Microtunnel, Bore and Jack, Horizontal Directional Drilling	Provide the approximate location of the sending and receiving pits.	Trenchless techniques are not proposed.
	Provide the length, width and depth of the sending and receiving pits.	Trenchless techniques are not proposed.
	Describe the methodology of excavating and shoring the pits.	Trenchless techniques are not proposed.
	Describe the methodology of the trenchless technique.	Trenchless techniques are not proposed.
	Provide the total cubic yardage of material to be removed from the pits, the amount to be used as backfill and the amount to subsequently be removed/disposed of off-site.	Trenchless techniques are not proposed.
	Describe the process for safe handling of drilling mud and bore lubricants.	Trenchless techniques are not proposed.
	Describe the process for detecting and avoiding "fracturing-out" during horizontal directional drilling operations.	Trenchless techniques are not proposed.
	Describe the process for avoiding contact between drilling mud/lubricants and stream beds.	Trenchless techniques are not proposed.
	If engineered fill would be used as backfill, provide information as to the type of engineered backfill and the amount that would be typically used (e.g., top two feet would be filled with thermal-select backfill).	Trenchless techniques are not proposed.
	If dewatering is anticipated, describe how the pit would be dewatered, what the anticipated flows of the water are, whether there would be treatment, and how the water would be disposed.	Trenchless techniques are not proposed.
	Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants.	Trenchless techniques are not proposed.
	If a pre-existing hazardous waste was encountered, describe the process of removal and disposal.	Trenchless techniques are not proposed.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.3.2 Trenchless Techniques: Microtunnel, Bore and Jack, Horizontal Directional Drilling	Describe any grading activities and/or slope stabilization issues.	Trenchless techniques are not proposed.
	Describe any standard BMPs that would be implemented.	Trenchless techniques are not proposed.
3.7.4 Substation Construction	Describe any earth-moving activities that would be required; what type of activity and, if applicable, estimate cubic yards of materials to be reused and/or removed from the site for both site grading and foundation excavation.	Section 3.6.3 Methods
	Provide a conceptual landscape plan in consultation with the municipality in which the substation is located.	Section 3.6.3 Methods Figure 4.1-4: Conceptual Landscape Plan
	Describe any grading activities and/or slope stabilization issues.	Section 3.6.3 Methods
	Describe possible relocation of commercial or residential property, if any.	No commercial or residential properties will be relocated as part of the Proposed Project.
3.7.5 Construction Workforce and Equipment	Provide the estimated number of construction crew members.	Section 3.6.4 Construction Equipment and Personnel Table 3-5: Construction Personnel Requirements
	Describe the crew deployment, whether crews would work concurrently (i.e., multiple crews at different sites), if they would be phased, etc.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-5: Construction Personnel Requirements Table 3-6: Proposed Construction Schedule

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.7.5 Construction Workforce and Equipment (cont.)	Describe the different types of activities to be undertaken during construction, the number of crew members for each activity (i.e., trenching, grading, etc.), and the number and types of equipment expected to be used for said activity. Include a written description of the activity.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements Table 3-6: Proposed Construction Schedule
	Provide a list of the types of equipment expected to be used during construction of the Proposed Project as well as a brief description of the use of the equipment.	Section 3.6.3 Methods Section 3.6.4 Construction Equipment and Personnel Table 3-4: Construction Equipment Requirements
3.7.6 Construction Schedule	Provide a preliminary project construction schedule; include contingencies for weather, wildlife closure periods, etc.	Table 3-6: Proposed Construction Schedule
3.8 Operation and Maintenance	Describe the general system monitoring and control (i.e., use of standard monitoring and protection equipment, use of circuit breakers and other line relay protection equipment, etc.).	Section 3.7 Operation and Maintenance
	Describe the general maintenance program of the Proposed Project including timing of inspections (i.e., monthly, every July, as needed), type of inspection (i.e., aerial inspection, ground inspection), and a description of how the inspection would be implemented. Things to consider: who/how many crew members, how would they access the site (i.e., walk to site, vehicle, all terrain vehicle), would new access be required, would restoration be required, etc.).	Section 3.7 Operation and Maintenance
	If additional full time staff would be required for operation and/or maintenance, provide the number of workers and for what purpose they are required.	Section 3.7 Operation and Maintenance No new full time staff would be required for operation and/or maintenance of the Proposed Project.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
3.9 Applicant-Proposed Measures	If there are measures that the Applicant would propose to be part of the Proposed Project, include those measures and reference plans or implementation descriptions.	Section 3.10 Applicant-Proposed Measures Table 3-8: Applicant-Proposed Measures
Chapter 4 – Environmental Setting		
	For each resource area discussion within the PEA, include a description of the physical environment in the vicinity of the Proposed Project (e.g., topography, land use patterns, biological environment, etc.), including the local environment (site-specific) and regional environment.	Section X.X.2 under each resource area provides a discussion of both the physical environment in the vicinity of the Proposed Project and the regulatory environment.
	For each resource area discussion within the PEA, include a description of the regulatory environment/context (federal, state, and local).	Section X.X.2 under each resource area provides a discussion of both the physical environment in the vicinity of the Proposed Project and the regulatory environment.
Chapter 5 – Environmental Impact Assessment Summary		
5.1 Aesthetics	Provide visual simulations of prominent public view locations, including scenic highways, to demonstrate the views before and after project implementation. Additional simulations are highly recommended.	Figure 4.1-5: Existing View and Visual Simulation – California Street Figure 4.1-6 Existing View and Visual Simulation – Southbound I-5
5.2 Agriculture and Forestry Resources	Identify the types of agricultural resources affected.	Section 4.2.3 Impacts No agricultural resources will be affected by the Proposed Project.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.3 Air Quality	Provide supporting calculations/spreadsheets/technical reports that support emission estimates in the PEA.	Table 4.3-6: Peak Daily Unmitigated Construction Emissions Table 4.3-7: Peak Daily Mitigated Construction Emissions Table 4.3-8: Peak Daily Operational Emissions Table 4.3-9: Maximum Daily Fugitive Dust Emissions from Construction Attachment 4.3-A: CalEEMod Input and Output Files
	Provide documentation of the location and types of sensitive receptors that could be impacted by the Project (e.g., schools, hospitals, houses, etc.). Critical distances to receptors is dependent on type of construction activity.	Section 4.3.2 Existing Conditions Section 4.3.3 Impacts Figure 4.10-1: Land Use Map
	Identify Proposed Project GHG emissions.	Section 4.7.3 Impacts Table 4.7-3: Greenhouse Gas Construction Emissions
	Quantify GHG emissions from a business as usual snapshot. That is, what the GHG emissions will be from the Proposed Project if no mitigations were used.	Section 4.7.3 Impacts
	Quantify GHG emission reductions from every APM that is implemented. The quantifications will be itemized and placed in tabular format.	Proposed Project emissions will be below the annual significance threshold set by the South Coast Air Quality Management District (SCAQMD) and the County of San Diego for industrial projects; therefore, mitigation will not be required. SDG&E's standard operating procedures will be implemented.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.3 Air Quality (cont.)	Identify the net emissions of the Proposed Project after mitigation have been applied.	Section 4.7.3 Impacts Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.
	Calculate and quantify GHG emissions (CO_2 equivalent) for the Proposed Project, including construction and operation.	Section 4.7.3 Impacts Table 4.7-3: Greenhouse Gas Construction Emissions
	Calculate and quantify the GHG reduction based on reduction measures proposed for the Proposed Project.	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.
	Propose APMs to implement and follow to maximize GHG reductions. If sufficient, CPUC will accept them without adding further mitigation measures.	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.
	Discuss programs already in place to reduce GHG emissions on a system-wide level. This includes the Applicant's voluntary compliance with the United States (U.S.) Environmental Protection Agency (EPA) SF_6 reduction program, reductions from energy efficiency, demand response, long-term procurement plan, et.al.	Section 4.7.2 Existing Conditions Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.3 Air Quality (cont.)	Ensure that the assessment of air quality impacts is consistent with PEA Sections 3.7.5 and 3.7.6, as well as with the PEA's analysis of impacts during construction, including traffic and all other emissions.	Section 4.3.2 Impacts Section 4.7.2 Impacts Table 4.3-6: Peak Daily Unmitigated Construction Emissions Table 4.3-7: Peak Daily Mitigated Construction Emissions Table 4.3-8: Peak Daily Operational Emissions Table 4.3-9: Maximum Daily Fugitive Dust Emissions from Construction Table 4.7-3: Greenhouse Gas Construction Emissions Attachment 4.3-A: CalEEMod Input and Output Files
5.4 Biological Resources	Provide a copy of the Wetland Delineation and supporting documentation (i.e., data sheets). If verified, provide supporting documentation. Additionally, GIS data of the wetland features should be provided as well.	A wetland delineation was not prepared for the Proposed Project as no jurisdictional features will be impacted.
	Provide a copy of special-status surveys for wildlife, botanical and aquatic species, as applicable. Any GIS data documenting locations of special-status species should be provided.	Section 4.4.1 Methodology Section 4.4.2 Existing Conditions Attachment 4.4-1: USFWS Species List
5.5 Cultural Resources	Cultural Resources Report documenting a cultural resources investigation of the Proposed Project. This report should include a literature search, pedestrian survey, and Native American consultation.	Attachment 4-A: Cultural Resources Summary

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.5 Cultural Resources (cont.)	Provide a copy of the records found in the literature search.	Table 4.5-1: Previously Recorded Cultural Resources within a 0.25-Mile Radius of the Proposed Area of Potential Effect Table 4.5-2: Previously Recorded Sites Built Resources within a 0.25-mile Radius of the Proposed Area of Potential Effect Attachment 4.5-A: Cultural Resources Summary
	Provide a copy of all letters and documentation of Native American consultation.	Attachment 4.5-B: NAHC Correspondence
5.6 Geology and Soils	Provide a copy of the geotechnical investigation if completed, including known and potential geologic hazards such as ground shaking, subsidence, liquefaction, etc.	Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation
5.7 Hazards and Hazardous Materials	Include an Environmental Data Resources report.	Attachment 4.8-A: Phase I Environmental Site Assessments
	Include a Hazardous Substance Control and Emergency Response Plan, if required.	Section 4.8.3 Impacts
	Include a Health and Safety Plan, if required.	Section 4.8.3 Impacts
	Describe the Worker Environmental Awareness Program.	Section 4.8.3 Impacts
	Describe which chemicals would be used during construction and operation of the Proposed Project. For example, fuels for construction, naphthalene to treat wood poles before installation, etc.	Section 4.8.3 Impacts Table 4.8-1: Hazardous Materials Typically Used for Construction
5.8 Hydrology and Water Quality	Describe impacts to groundwater quality including increased runoff due to construction of impermeable surfaces, etc.	Section 4.9.3 Impacts
	Describe impacts to surface water quality including the potential for accelerated soil erosion, downstream sedimentation, and reduced surface water quality.	Section 4.9.3 Impacts

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.9 Land Use and Planning	Provide GIS data of all parcels within 300 feet of the Proposed Project with the following data: APN number, mailing address, and parcel's physical address.	The property owner information has been submitted under separate cover due to its confidential nature.
5.10 Mineral Resources	Data needs already specified under Chapter 3 would generally meet the data needs for this resource area.	Not Applicable
5.11 Noise	Provide long-term noise estimates for operational noise (e.g., corona discharge noise, and station sources such as substations, etc.).	Section 4.12.3 Impacts Attachement 4.12-A: Noise Technical Report
5.12 Population and Housing	Data needs already specified under Chapter 3 would generally meet the data needs for this resource area.	Not Applicable
5.13 Public Services	Data needs already specified under Chapter 3 would generally meet the data needs for this resource area.	Not Applicable
5.14 Recreation	Data needs already specified under Chapter 3 would generally meet the data needs for this resource area.	Not Applicable
5.15 Transportation and Traffic	Discuss traffic impacts resulting from construction of the Proposed Project including ongoing maintenance operations.	Section 4.16.3 Impacts
	Provide a preliminary description of the traffic management plan that would be implemented during construction of the Proposed Project.	Encroachment permits from local and state jurisdictional agencies will provide guidance on required traffic management measures. It is expected that a Project-specific Traffic Management Plan will be required as part of the encroachment permit submittals.
5.16 Utilities and Services Systems	Describe how treated wood poles would be disposed of after removal, if applicable.	3.6.3 Methods
5.17 Cumulative Analysis	Provide a list of projects (i.e., past, present, and reasonably foreseeable future projects) within the Proposed Project area that the applicant is involved in.	Table 4.18-1: Planned and Proposed Projects within One Mile

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
5.17 Cumulative Analysis (cont.)	Provide a list of projects that have the potential to be proximate in space and time to the Proposed Project. Agencies to be contacted include, but are not limited to, the local planning agency, Caltrans, etc.	Table 4.18-1: Planned and Proposed Projects within One Mile
5.18 Growth-Inducing Impacts, If Significant	Provide information on the Proposed Project's growth-inducing impacts, if any.	Section 5.3 Growth Inducing Impacts Section 4.13.3 Impacts
	Provide information on any economic or population growth in the surrounding environment that will, directly or indirectly, result from the Proposed Project.	
	Provide information on any increase in population that could further tax existing community service facilities (e.g., schools, hospitals, fire, police, etc.), that will directly or indirectly result from the Proposed Project.	
	Provide information on any obstacles to population growth that the Proposed Project would remove.	
	Describe any other activities, directly or indirectly encouraged or facilitated by the Proposed Project, that would cause population growth that could significantly affect the environment, either individually or cumulatively.	
Chapter 6 – Detailed Discussion of Significant Impacts		
6.1 Mitigation Measures Proposed to Minimize Significant Effects	Discuss each mitigation measure and the basis for selecting a particular mitigation measure should be stated.	Section 3.10 Applicant-Proposed Measures Table 3-8: Applicant-Proposed Measures Section 4.X.3 Impacts Section 4.X.4 Applicant-Proposed Measures

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
6.2 Description of Project Alternatives and Impact Analysis	Provide a summary of the alternatives considered that would meet most of the objectives of the Proposed Project and an explanation as to why they were not chosen as the Proposed Project.	Section 5.2 Description of Project Alternatives and Impact Analysis Section 5.2.4 System Alternatives Section 5.2.5 Construct a New Substation Alternative Table 5-1: Alternatives Considered Table 5-2: Alternative Site Comparison Summary
	Alternatives considered and described by the Applicant should include, as appropriate, system or facility alternatives, route alternatives, route variations, and alternative locations.	Section 5.2 Description of Project Alternatives and Impact Analysis Section 5.2.4 System Alternatives Section 5.2.5 Construct a New Substation Alternative Table 5-1: Alternatives Considered
	Include a description of a "No Project Alternative" should be included.	Section 5.2.3 No Project Alternative
	If significant environmental effects are assessed, the discussion of alternatives shall include alternatives capable of substantially reducing or eliminating any said significant environmental effects, even if the alternative(s) substantially impede the attainment of the Proposed Project objectives and are more costly.	No significant environmental effects are anticipated after implementation of the APMs.
6.3 Growth-Inducing Impacts	Discuss if the Proposed Project would foster economic or population growth, either directly or indirectly, in the surrounding environment.	Section 5.3 Growth-Inducing Impacts
	Discuss if the Proposed Project would cause an increase in population that could further tax existing community services (e.g., schools, hospitals, fire, police, etc.).	Section 5.3 Growth-Inducing Impacts

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
6.3 Growth-Inducing Impacts (cont.)	Discuss if the Proposed Project would remove obstacles to population growth.	Section 5.3 Growth-Inducing Impacts
	Discuss if the Proposed Project would encourage and facilitate other activities that would cause population growth that could significantly affect the environment, either individually or cumulatively.	Section 5.3 Growth-Inducing Impacts
6.4 Suggested Applicant-Proposed Measures to address GHG Emissions	Include a menu of suggested APMs that applicants can consider to address GHG emissions. Suggested APMs include, but are not limited to: 1. If suitable park-and-ride facilities are available in the Project vicinity, construction workers will be encouraged to carpool to the job site to the extent feasible. The ability to develop an effective carpool program for the Proposed Project would depend upon the proximity of carpool facilities to the job site, the geographical commute departure points of construction workers, and the extent to which carpooling would not adversely affect worker show-up time and the Project's construction schedule. 2. To the extent feasible, unnecessary construction vehicle and idling time will be minimized. The ability to limit construction vehicle idling time is dependent upon the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel powered vehicles, have extended warm-up. To the extent feasible, unnecessary construction vehicle and idling time will be minimized. The ability to limit construction vehicle idling time is dependent upon the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel powered vehicles, have extended warm-up times following start-up that limit their availability for use following startup. Where such diesel powered	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
6.4 Suggested Applicant-Proposed Measures to address GHG Emissions (cont.)	have extended warm-up times following start-up that limit their availability for use following startup. Where such diesel powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The Proposed Project will apply a "common sense" approach to vehicle use; if a vehicle is not required for use immediately or continuously for construction activities, its engine will be shut off. Construction foremen will include briefings to crews on vehicle use as part of pre-construction conferences. Those briefings will include discussion of a "common sense" approach to vehicle use. 3. Use low-emission construction equipment. Maintain construction equipment per manufacturing specifications and use low-emission equipment described here. All offroad construction diesel engines not registered under the California Air Resources Board (CARB) Statewide Portable Equipment Registration Program shall meet at a minimum the Tier 2 California Emission Standards for Off-Road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, Sec. 2423(b)(1). 4. Diesel Anti-Idling: In July 2004, the CARB adopted a measure to limit diesel-fueled commercial motor vehicle idling. 5. Alternative Fuels: CARB would develop regulations to require the use of one to four percent biodiesel displacement of California diesel fuel. 6. Alternative Fuels: Ethanol, increased use of ethanol fuel 7. Green Buildings Initiative. 8. Facility wide energy efficiency audit.	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
6.4 Suggested Applicant-Proposed Measures to address GHG Emissions (cont.)	9. Diesel Anti-Idling: In July 2004, the CARB adopted a measure to limit diesel-fueled commercial motor vehicle idling. 10. Alternative Fuels: CARB would develop regulations to require the use of one to four percent biodiesel displacement of California diesel fuel. 11. Alternative Fuels: Ethanol, increased use of ethanol fuel 12. Green Buildings Initiative. 13. Facility wide energy efficiency audit. 14. Complete GHG emissions audit. The audit will include a review of the GHG emitted from those facilities (substations), including carbon dioxide, methane, CFC, and HFC compounds (SF_6). 15. There is an EPA approved SF_6 emissions protocol (http://www.epa.gov/electricpowersf6/resources/index.html#three). 16. SF_6 program wide inventory. For substations, keep inventory of leakage rates. 17. Increase replacement of breakers once leakage rates exceed one percent within 30 days of detection. 18. Increased investment in current programs that can be verified as being in addition to what the utility is already doing. 19. The SF6 Emission Reduction Partnership for the Electric Power Systems was launched in 1999 and currently includes 57 electric utilities and local governments across the U.S. of applications, including that of dielectric insulating material in electrical transmission and distribution equipment, such as circuit breakers. Electric power systems that join the Partnership must, within 18	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.

Location in CPUC Checklist	Checklist Item	Location in PEA and Any Associated Notes
6.4 Suggested Applicant-Proposed Measures to address GHG Emissions (cont.)	months, establish an emission reduction goal reflecting technically and economically feasible opportunities within their company. They also agree to, within the constraints of economic and technical feasibility, estimate their emissions of SF6, establish a strategy for replacing older, leakier pieces of equipment, implement SF6 recycling, establish and apply proper handling techniques, and report annual emissions to the EPA. The EPA works as a clearinghouse for technical information, works to obtain commitments from all electric power system operators and will be sponsoring an international conference in 2000 on SF6 emission reductions. 20. Quantify what comes into the system and track programmatically SF6. 21. Applicant can propose other GHG reducing mitigations.	Proposed Project emissions will be below the annual significance threshold set by the SCAQMD and the County of San Diego for industrial projects, and therefore mitigation will not be required.
Chapter 7: Other Process-Related Data Needs		
Noticing	Include an excel spreadsheet that identifies all parcels within 300 feet of any Proposed Project component with the following data: APN number, owner mailing address, and parcels physical address.	The property owner information has been submitted under separate cover due to its confidential nature.

CHAPTER 2 – PROJECT PURPOSE AND NEED

This section of the Proponent's Environmental Assessment (PEA) identifies the objectives, purpose, and need for San Diego Gas & Electric Company's (SDG&E's) proposed Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project), as required by the California Public Utilities Commission's (CPUC's) PEA Guidelines (CPUC Information and Criteria List, Appendix B, Section V) and the California Environmental Quality Act (CEQA) Guidelines (Section 15126.6[a]).

2.0 OVERVIEW

SDG&E is a regulated public utility that provides electric service to approximately 1.4 million customers within an approximately 4,100-square-mile service area, covering 25 cities and unincorporated areas within San Diego County and a portion of Orange County. The Proposed Project involves the construction of a new substation to meet existing and anticipated customer-driven electrical load growth and to improve distribution equipment reliability that will prevent potential long outages or disruption of service to existing customers in SDG&E's service territory in downtown and the surrounding area.

In providing electrical service to downtown and the surrounding area, SDG&E currently operates four substations: Kettner Substation, Urban Substation, Station B Substation, and Sampson Substation. SDG&E also operates the Grant Hill Substation—an existing facility in the surrounding area that was also evaluated as a potential source to serve load in downtown and the surrounding areas. In particular, Kettner Substation is an aging facility with a variety of reliability concerns that provides service to the San Diego International Airport and the Point Loma Wastewater Treatment Plant. Commercial and residential growth in the downtown area is loading the existing substations to their ultimate capacities. Recent load additions in downtown and the surrounding area include an expansion of San Diego International Airport and construction of Ballpark Village, a new mixed-use development consisting of apartments, condominiums, and commercial and retail space, which is expected to commence construction at the end of 2015. These developments will add additional load to the existing substations serving downtown and the surrounding area. As a result, the proposed Vine Substation is needed to allow offloading of the existing substations and thereby allow SDG&E to maintain its current reliability of service to existing and new customers in downtown and the surrounding areas.

Because the projected load indicates that the Station B and Urban substations will exceed 100 percent of their capacity and the Kettner and Sampson substations will exceed 85 percent of their capacity in 2018, SDG&E has determined that an additional 30 megavolt-amperes (MVA) are needed by mid-2017 to address reliability concerns and serve the projected electric distribution load growth. The optimum maximum substation load is 85 percent, as it allows for transformer bank loads to be transferred in the event of a transformer bank outage. Optimum operating conditions maintain substation reliability and reduce outage times. All of the substations—with the exception of the Grant Hill and Sampson substations—are near capacity and will begin to exceed their 85-percent ratings in 2015 or sooner. The Grant Hill Substation has approximately 33 MVA of remaining capacity; however, expansion of this substation would likely require substantial power line and distribution upgrades. In addition, the Grant Hill Substation is located

outside of the desired coverage area and would result in system inefficiencies. Therefore, the proposed Vine Substation is needed by mid-2017 to eliminate existing reliability concerns at the Kettner Substation and to provide additional capacity to help offload the existing congested substations in downtown and the surrounding area.

The prime driving factors in determining the need to construct a new substation in the area are:

- the need to maintain reliable service to SDG&E commercial and residential customers in the San Diego downtown and surrounding area,
- the expected electrical load growth of 30 MVA by mid-2017, and
- the need to prevent extended outages and disruption of services to new and existing customers in the area.

SDG&E considers additional substation transformer capacity when the loss of a single transformer may cause an interruption to major commercial/industrial load that cannot be restored through use of 12 kV circuit ties to other substations. The downtown and surrounding area is approaching this threshold. Therefore, SDG&E is considering planning and design of the proposed Vine Substation to provide tie capacity in the event of a loss of a single transformer.

2.1 PROJECT OBJECTIVES

The objectives of the Proposed Project include the following:

- Objective 1: Maintain existing substation and distribution system reliability standards.
- Objective 2: Provide substation and circuit tie capacity that will provide additional reliability for existing and future system needs.
- Objective 3: Meet the area's long-term electric distribution capacity needs by constructing a substation near planned load growth.
- Objective 4: Utilize existing SDG&E-owned land previously purchased for substation use to meet the scheduled in-service date.

The Proposed Project components, their locations, preliminary configuration, and the existing and proposed system configuration are presented in Chapter 3 – Project Description. Each of the Proposed Project objectives is more thoroughly described in the subsections that follow.

2.1.0 Objective 1: Maintain Existing Reliability Standards for the Distribution and Substation Systems

The addition of the proposed Vine Substation will help to maintain reliability for existing distribution and substation systems within downtown and the surrounding area—including reliability concerns at the Kettner Substation. The Kettner Substation is an aging substation that provides service to major customers that serve critical regional needs, such as the San Diego International Airport and the Point Loma Wastewater Treatment Plant. The Kettner Substation has a variety of reliability issues including its physical configuration and its aging infrastructure. These issues could become an operations/security/safety issue if not addressed. Construction of the proposed Vine Substation will allow the reliability concerns at the Kettner Substation be addressed by adding operational flexibility and ultimately provide 90 MVA of additional

capacity. The proposed Vine Substation will offload approximately 30 MVA from the Station B Substation and 40 MVA from the Kettner Substation, bringing them within the optimum loading standards.

2.1.1 Objective 2: Provide Improved Substation and Circuit Reliability with Added Tie Capacity

Installation of a new substation provides an increased number of substation transformer banks and circuits that will provide for an increased number of circuit ties. Reliability improves with balanced circuit loading and increased number of circuits to transfer load in the event of a circuit or branch outage.

2.1.2 Objective 3: Meet the Area Electric Capacity Needs

The downtown San Diego area is fed primarily from the Kettner Substation, Urban Substation, Station B Substation, and Sampson Substation. These four substations will exceed their maximum capacity by 2018. Grant Hill Substation, which is outside of the downtown coverage area, has approximately 33 MVA of capacity remaining; however, expansion of this substation would likely require substantial power line and distribution upgrades. In addition, the Grant Hill Substation is located outside of the desired coverage area and therefore, would result in system inefficiencies. The proposed Vine Substation will initially add a 60 MVA increase in capacity to serve downtown San Diego and the surrounding area, including the San Diego International Airport expansion project and development projects, such as Ballpark Village.

2.1.3 Objective 4: Utilize Existing SDG&E-owned Land Previously Purchased for Substation Use to Meet the Scheduled In-service Date

The Vine Substation is proposed to be located on an approximately 1.5-acre parcel currently owned by SDG&E within the Midway/Pacific Highway Corridor Community Plan area. The property was purchased in 1976 in anticipation of constructing the Laurel Street Substation. The Laurel Street Substation was never constructed and in 1988, it was leased as a parking lot. Because the site is already owned by SDG&E, no time to acquire the property will be necessary. As a result, the in-service date will not be compromised.

2.2 CONCLUSION

The Proposed Project will result in the construction of a new 69/12 kV substation to provide additional capacity to serve existing and future area load and to prevent potentially long outages or disruption of service to existing and new customers in downtown and the surrounding area. In doing so, the Proposed Project will meet the four project objectives, which include meeting reliability standards, improving reliability, adding capacity, and meeting the Proposed Project schedule.

CHAPTER 3 – PROJECT DESCRIPTION

3.0 PROJECT LOCATION

The proposed Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) is located in the southwestern portion of the City of San Diego (City), California approximately 2 miles northwest of downtown San Diego and directly adjacent to and east of San Diego International Airport (also known as Lindberg Field). The main activity associated with the Proposed Project involves the construction of the proposed Vine Substation, which will be located at the corner of Vine Street and Kettner Boulevard. The Proposed Project will also involve the relocation of distribution circuits and loop in of an existing 69 kV power line.

For the purposes of this document, the Proposed Project is divided into the following four major components:

1. Construction of the proposed Vine Substation
2. Installation/relocation of distribution circuits
3. Construction of a 69 kV loop-in
4. Upgrade of an existing telecommunication system

The location of the Proposed Project is depicted in Figure 3-1: Project Location Map and the four Proposed Project components are depicted in Figure 3-2: Project Overview Map. The estimated total cost associated with constructing the Proposed Project will be between $42 million and $45 million with allowance for funds used during construction. A more detailed description of the area within and around the Proposed Project follows.

3.0.0 Proposed Vine 69/12 kV Substation

The proposed Vine Substation site is located at the southwestern corner of the intersection of Vine Street and Kettner Boulevard, just west of Interstate (I-) 5 and east of Pacific Highway. The site is situated on a 1.5-acre parcel that is owned by SDG&E and is currently being leased for long-term airport parking. The parcel is bordered to the north by Vine Street and a commercial printing business across Vine Street, to the south by an Advantage Rental Car facility, to the east by Kettner Boulevard, and to the west by the North County Transit District Coaster and San Diego Metropolitan Transit System (MTS) Trolley rail tracks. The area is characterized by light- and medium-industrial and office uses, parking lots, and rental car facilities. The completed substation will measure approximately 305 feet by 180 feet, requiring approximately 1.3 acres. The proposed substation site is depicted on Figure 3-2: Project Overview Map and in Attachment 3-A: Detailed Project Components Map.

3.0.1 12 kV Distribution Relocation

As indicated in Table 3-1: Distribution Relocation Summary, approximately eight existing distribution circuits will be intercepted and relocated to the proposed Vine Substation. As part of the relocation process, the circuits will be renumbered. The relocated distribution circuits will generally travel along Kettner Boulevard between West Hawthorn Street and Vine Street within public rights-of-way (ROWs). Existing customer uses along the relocated circuits include I-5 to the east and rental car facilities, offices, and airport parking lots to the west. The relocation

process will utilize a combination of existing and new underground distribution conduit, as depicted in Figure 3-2: Project Overview Map and in Attachment 3-A: Detailed Project Components Map.

Table 3-1: Distribution Relocation Summary

Existing Distribution Circuit Number	Approximate Interception Point[1]	Proposed Distribution Circuit Number
135	Adjacent to the Kettner Substation	1476
137	Adjacent to the Kettner Substation	1477
138	Adjacent to the Kettner Substation	1478
139	Adjacent to the Kettner Substation	1479
458	Adjacent to the proposed Vine Substation	1480
108	Kettner Boulevard and West Hawthorn Street	1481
	Pacific Highway and West Hawthorn Street	
113	Kettner Boulevard and West Laurel Street	1482
102	Kettner Boulevard and West Hawthorn Street	1483
139	Adjacent to the Kettner Substation	1484

The distribution circuits will be relocated and/or newly installed entirely within the franchise position of City of San Diego public streets, and no additional ROW will be acquired. Approximately 1,300 feet of new duct bank will be installed within Kettner Boulevard between West Laurel Street and the Kettner Substation. An additional 2,600 feet of two new duct banks will be installed between the Kettner Substation and the proposed Vine Substation. Approximately 20 additional feet of additional duct banks will be installed facilitate the stub out of two new duct packages from the proposed Vine Substation. Up to an additional 400 feet of duct bank will be used to facilitate the connection of these new duct banks with existing underground conduit and aboveground facilities.

In addition to the new underground duct banks, approximately 3,600 feet of existing, empty duct bank will be utilized during the relocation. These existing facilities are located within Pacific Highway, between West Hawthorn Street and West Laurel Street; West Laurel Street, between Pacific Highway and Kettner Boulevard; and Kettner Boulevard, between West Hawthorn Street and West Laurel Street.

[1] The final interception points and duct bank design will be determined upon final engineering of the Proposed Project and are subject to change.

3.0.2 69 kV Loop-In

The power line component of the Proposed Project will consist of looping in an existing 69 kV tie-line—Tie-Line (TL) 604—to the proposed Vine Substation. The existing overhead power line is located adjacent to and to the west of the proposed substation site. TL604 travels generally south from the Old Town Substation by spanning existing railroad tracks and Witherby Street, then traveling southeast along Kurtz Street. The line then spans Noell Street and continues parallel to and adjacent to the south side of the existing railroad tracks. Near the intersection of California Street and Vine Street, the line spans the railroad tracks, reaching the existing wood pole at the intersection of California Street and Vine Street. The line then spans the railroad tracks again and travels southeast parallel to the railroad tracks. After spanning West Palm Street, the line turns northeast, travels along West Palm Street, and terminates at the Kettner Substation.

The 69 kV loop-in will involve removing two existing wood poles near the corner of California Street and Vine Street (along with an existing span guy pole) and installing three new self-supported tubular steel poles (TSPs) directly adjacent to the eastern lane of Pacific Highway, as depicted in Figure 3-2: Project Overview Map. The TSPs will be a maximum of 100 feet tall and will taper from approximately two to three feet in diameter at the top to approximately five to seven feet at the base. New overhead conductor will be used to connect these new poles to the existing power line and the proposed substation, creating the loop-in. The new power line poles will be installed within the franchise position along Pacific Highway. SDG&E will obtain a License Agreement from MTS for the approximately 80 feet of new, approximately 320-foot-wide ROW for the overhead conductors. The remainder of the 69 kV loop-in will be installed within the francise position of City of San Diego public streets.

3.0.3 Telecommunication System Extension

SDG&E's substations typically utilize a telecommunication system composed of SDG&E fiber optic cable and an AT&T telephone line to facilitate off-site monitoring and operation. In order to connect the proposed Vine Substation and Kettner Substation to this system, additional fiber optic cable will be installed as part of the Proposed Project.

In order to bring fiber communication from the proposed Vine Substation to Kettner Substation, approximately 2,850 feet of new underground fiber optic cable will be installed within the previously described underground 12 kV distribution duct banks.[2] The proposed Vine Substation will be connected to the existing telecommunication network by adding approximately 100 feet of fiber optic cable from an existing underground handhole located within Pacific Highway to one of the new 69 kV TSPs that will be installed as part of the loop-in. The fiber optic cable will then travel overhead, across the existing railroad tracks, to the proposed Vine Substation within the power line's ROW.

[2] Telecommunications cable will not enter the underground distribution vaults. As a result, short sections of underground duct bank specific to telecommunication cable will be installed to route around the underground distribution vaults. While located separate from the distribution facilities, the telecommuncations cable will enter underground handholes specific to telecommunication cable. The locations where the telecommunication and distribution duct banks are not conincident are presented in Attachment 3-A: Detailed Project Components Map.

The AT&T phone line will be upgraded and relocated from a current system feeding the existing customer at the site. As depicted in Attachment 3-A: Detailed Project Components Map, one of three potential interconnection points located adjacent to the proposed Vine Substation will be used to facilitate the connection.

3.1 EXISTING SYSTEM

SDG&E is a regulated public utility that provides electric service to approximately 1.4 million customers within an approximately 4,100-square-mile service area, covering 25 cities and unincorporated areas within San Diego County and a portion of Orange County.

Figure 3-3: Existing System Configuration and Figure 3-4: Proposed System Configuration provide schematic diagrams of the existing system and the system as it would be configured following construction of the Proposed Project, respectively. As shown in Figure 3-3: Existing System Configuration, one existing tie-line—TL604—connects the Kettner Substation to the Old Town Substation. Five existing distribution lines—Circuits (C) 135, C137, C138, C139, and C458—currently connect to the Kettner Substation. The remaining three distribution lines that will be relocated—C108, C113, and C102—originate at the Station B Substation. As shown in Figure 3-4: Proposed System Configuration, TL604 will be looped into the proposed Vine Substation from the Old Town Substation, and a new tie-line—TL6976—will be created, connecting the proposed Vine Substation to the Kettner Substation. In addition, all eight of the distribution circuits will be relocated from either the Kettner Substation or the Station B Substation to the proposed Vine Substation, creating Circuits 1476 through 1484.

3.2 PROJECT OBJECTIVES

This project is being proposed to meet several objectives identified by SDG&E. The primary objective of the Proposed Project is to construct a new substation with associated 69 kV loop-in, and to relocate/re-arrange various distribution circuits. The project is designed to eliminate existing reliability concerns at Kettner and to provide additional capacity to serve existing and future area load and to prevent potential long outages or disruption of service to existing and new customers in the San Diego downtown and surrounding area.

Basic objectives of the Proposed Project include the following:

- Objective 1: Maintain existing substation and distribution system reliability standards.
- Objective 2: Provide substation and circuit tie capacity that will provide additional reliability for existing and future system needs.
- Objective 3: Meet the area's long-term electric distribution capacity needs by constructing a substation near planned load growth.
- Objective 4: Utilize existing SDG&E-owned land previously purchased for substation use to meet the scheduled in-service date.

Chapter 2 – Project Purpose and Need provides additional details regarding the Proposed Project's objectives.

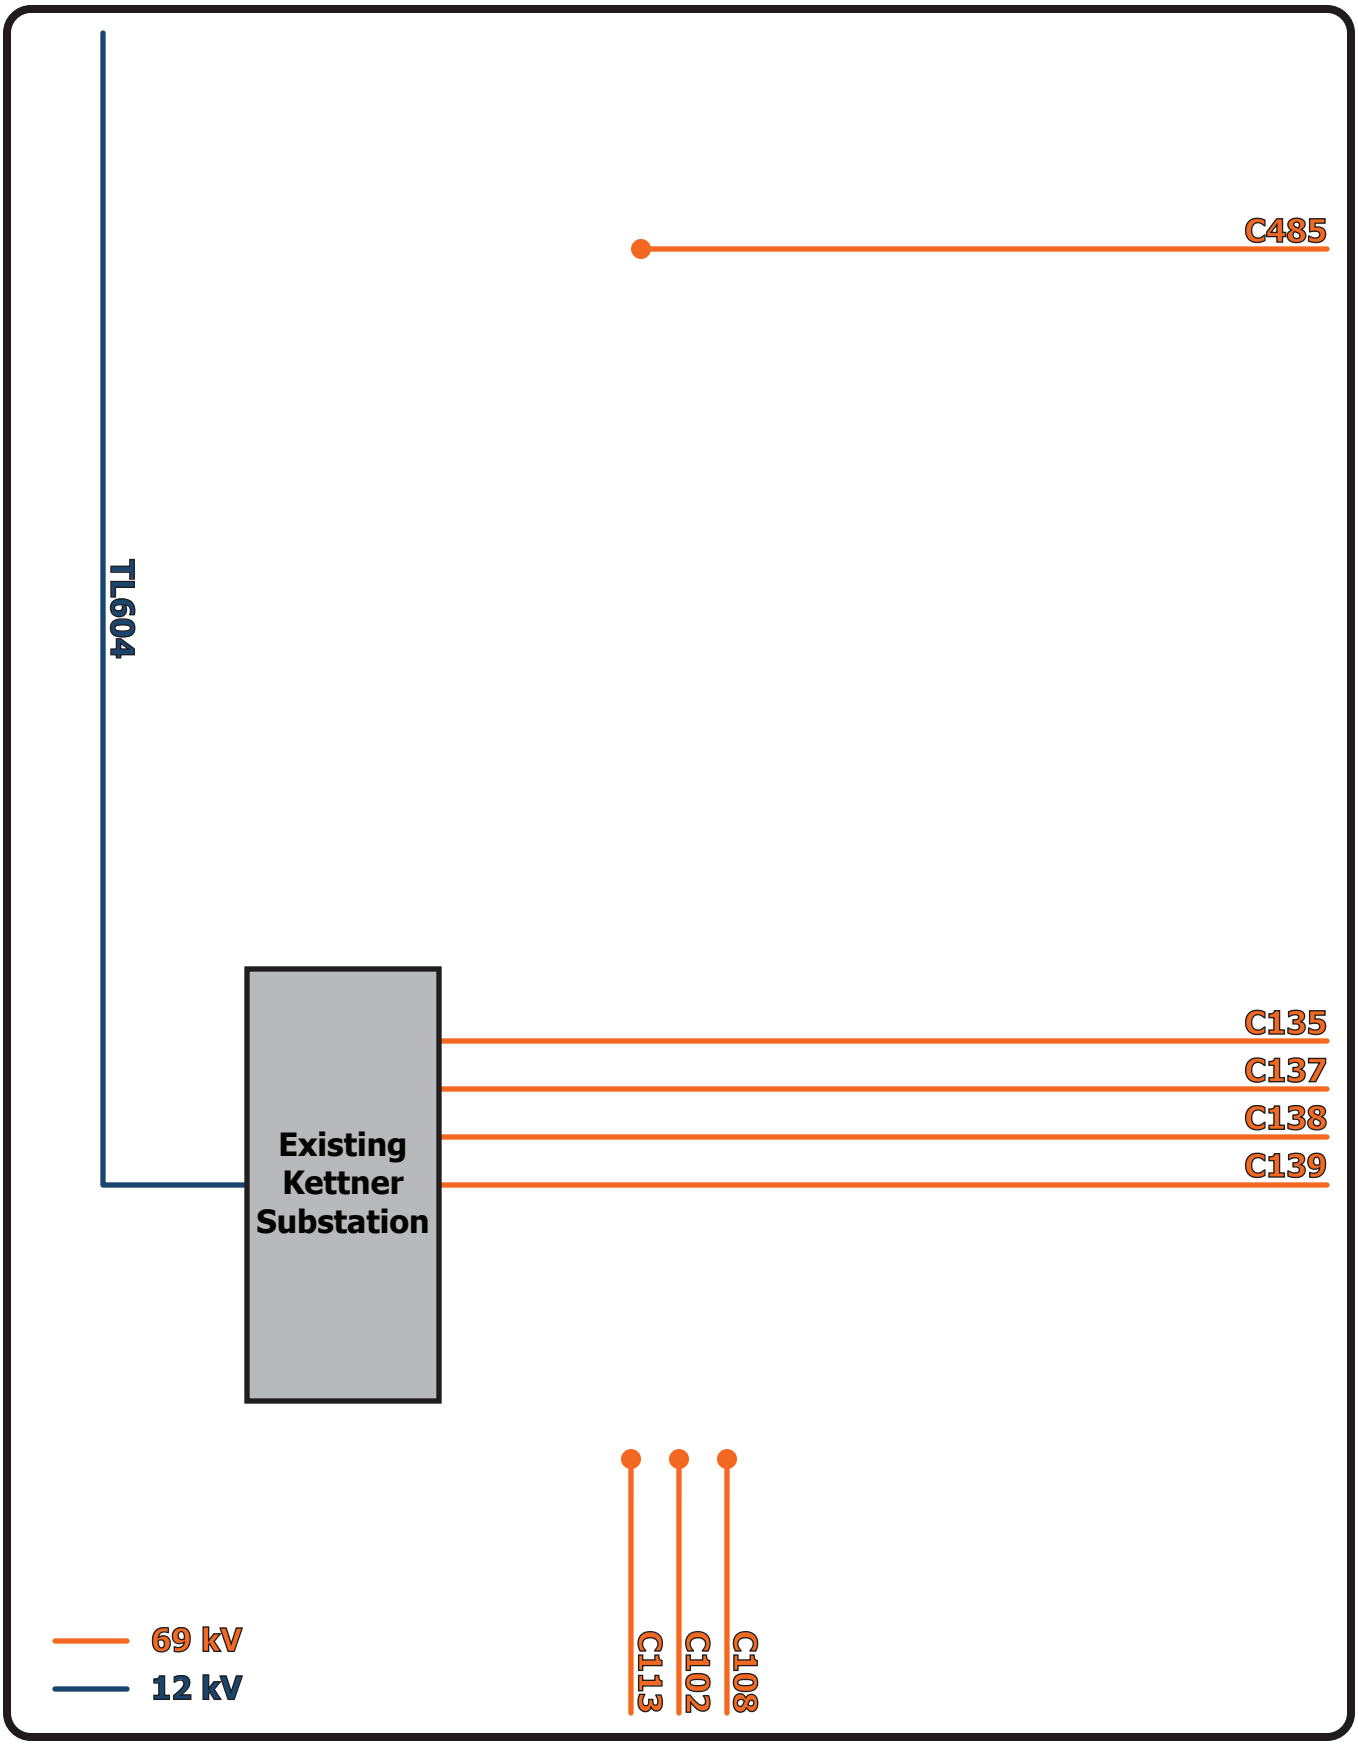

Figure 3-3: Existing System Configuration

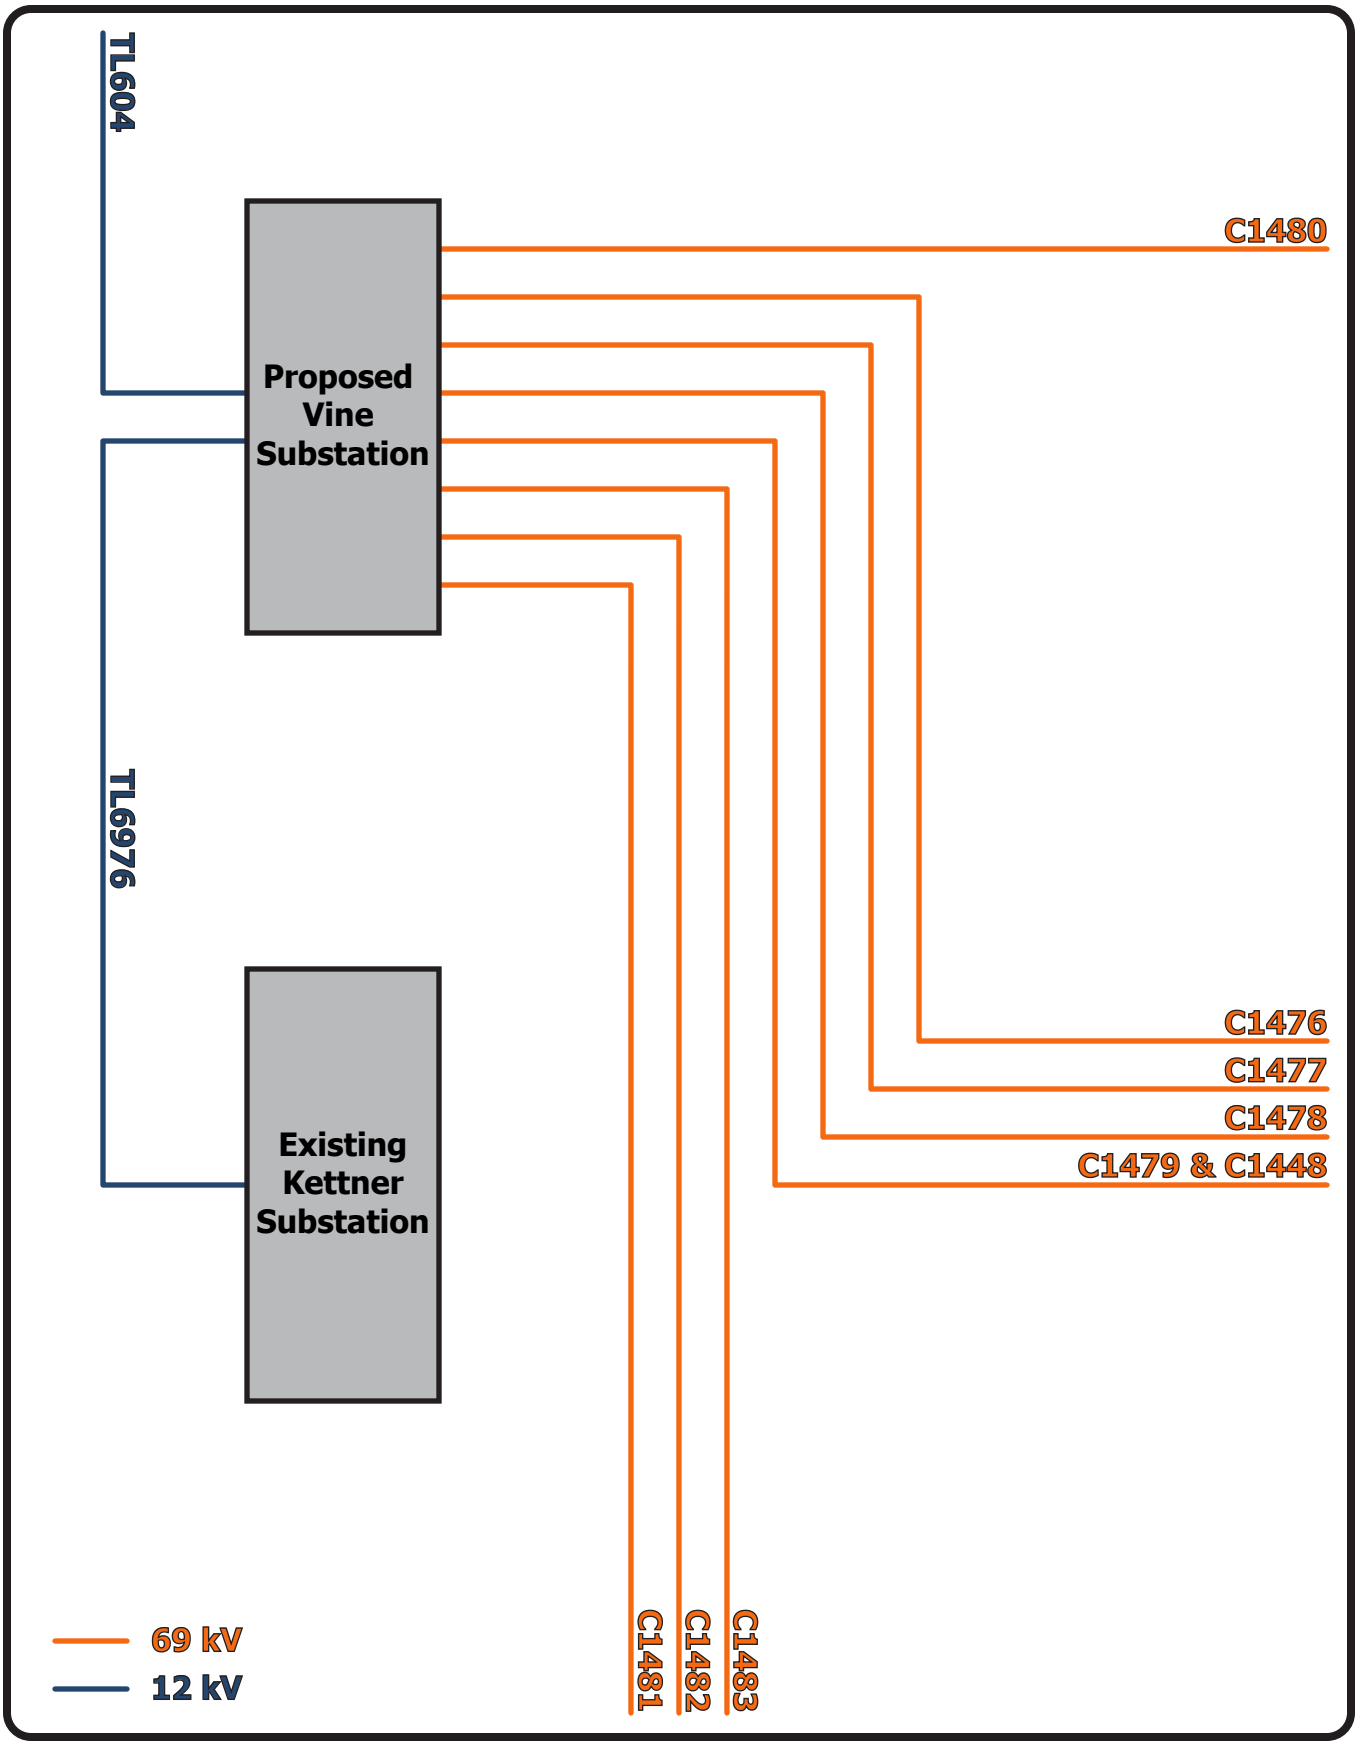

Figure 3-4: Proposed System Configuration

3.3 PROJECT CAPACITY

The power line component of the Proposed Project involves looping in existing TL604 to the proposed Vine Substation, which will serve as the 69 kV source for the new substation. All throughout the 69 kV loop-in portion of the Proposed Project, there will be no added capacity required to facilitate this source feeding the proposed Vine Substation.

The distribution component of the Proposed Project involves relocating existing 12 kV circuits currently served by Kettner and Station B substations (approximately 30 MVA of load) to the proposed Vine Substation. Initially, this will net 60 MVA of capacity to serve downtown San Diego and the surrounding areas. Once the substation is built to its ultimate capacity, an additional 30 MVA will be added. The result will be a net 90 MVA increase in capacity available to serve downtown San Diego and the surrounding area. The increased capacity will serve existing and future load growth that is expected within the vicinity of the substation.

3.4 PROPOSED PROJECT

3.4.0 Proposed Vine 69/12 kV Substation

The proposed Vine Substation is planned to occupy approximately 1.3 acres (approximately 305 feet by 180 feet) within a 1.5-acre parcel. The site will be enclosed by an approximately 10-foot-tall, brown "Lapaz" brown colored, masonry perimeter wall.

With regard to the Proposed Project's phasing, two arrangements—the initial and ultimate—are discussed in this section. The steel structures within the substation will be comprised of galvanized steel, while the transformers, breakers, switchgear, and capacitors will be painted ANSI 70 Grey. The control shelter and screen wall will be constructed from "Lapaz" brown masonry blocks and will include a welded metal roof.

As depicted in Figure 3-5: Vine Substation Initial Arrangement, the proposed substation will include the following pieces of major equipment as part of the initial 90 MVA configuration:

- Two 69 kV tie-line terminations
- Six 69 kV gas circuit breakers
- Three 69 kV potential transformers
- Three 69/12 kV standard profile, low-sound 30 MVA transformers
- Three ¼ sections of switch gear to accommodate twelve 12 kV circuits
- Three 12 kV metal-enclosed capacitor banks
- One 12 kV metal-enclosed reactor bank
- One approximately 30-foot-tall standard steel rack consisting of a 69 kV bus
- One approximately 20-foot-wide by 40-foot-long by 11-foot-tall masonry block control shelter

At its ultimate configuration, the substation is planned to be a 120 MVA, 69/12 kV distribution substation. As depicted in Figure 3-6: Vine Substation Ultimate Arrangement, the substation will include a total of the following components:

- Four 69 kV tie-line terminations
- Nine 69 kV gas circuit breakers
- Three 69 kV potential transformers
- Four 69/12 kV standard profile, low-sound 30 MVA transformers
- Four ¼ sections of switch gear to accommodate sixteen 12 kV circuits
- Four 12 kV metal-enclosed capacitor banks
- Two 12 kV metal-enclosed reactor banks
- One approximately 30-foot-tall standard steel rack consisting of a 69 kV bus
- One approximately 20-foot-wide by 40-foot-long by 11-foot-tall masonry block control shelter

Oil spill containment basins will be installed around the transformers to capture any oil accidentally leaked from these components. The basins will be designed to have a capacity that exceeds the transformer capacity by 10 percent. Under the ultimate arrangement, the four transformers will contain approximately 24,100 gallons of oil (varies slightly by manufacturer).

Substation lighting will be provided by a mixture of high-pressure sodium and metal halide lights that will be installed to adhere to the following SDG&E standards:

- provide enough light for a safe entry and exit from the substation;
- allow for safe driving around busses/racks, corners, and roadways; and
- allow for a preliminary visual inspection of the substation.

With the exception of the gate entry lights, which will remain on at night for safety purposes, the remaining substation lighting will not be turned on unless it is required for nighttime work and/or an emergency. One light will be installed at the main gate, one light will be installed on each side of the control shelter, and a minimum of two lights will be installed on each substation wall. Lights may also be installed on the end of the steel rack if required. All on-site lighting will be oriented downward to minimize glare onto the surrounding property.

As described previously, an approximately 10-foot-tall masonry wall will enclose the entire substation. Two approximately 10-foot-tall and 30-foot-wide sliding gates will be installed within the perimeter wall to provide primary and secondary access to the substation. The gates will be constructed from chain-link material and will be designed to accommodate standard brown slats. Barbed wire will be installed horizontally along the interior of the wall and gates so as to not be visible from the exterior of the substation. The primary access will be from Vine Street and will require relocation of the existing driveway approximately 50 feet southwest. An existing driveway from Kettner Boulevard will be relocated approximately 125 feet southeast and will provide secondary access to the site. The two gates will be locked and monitored remotely to limit access to only authorized personnel. Warning signs will be posted on the substation wall and gates in accordance with federal, state, and local safety regulations.

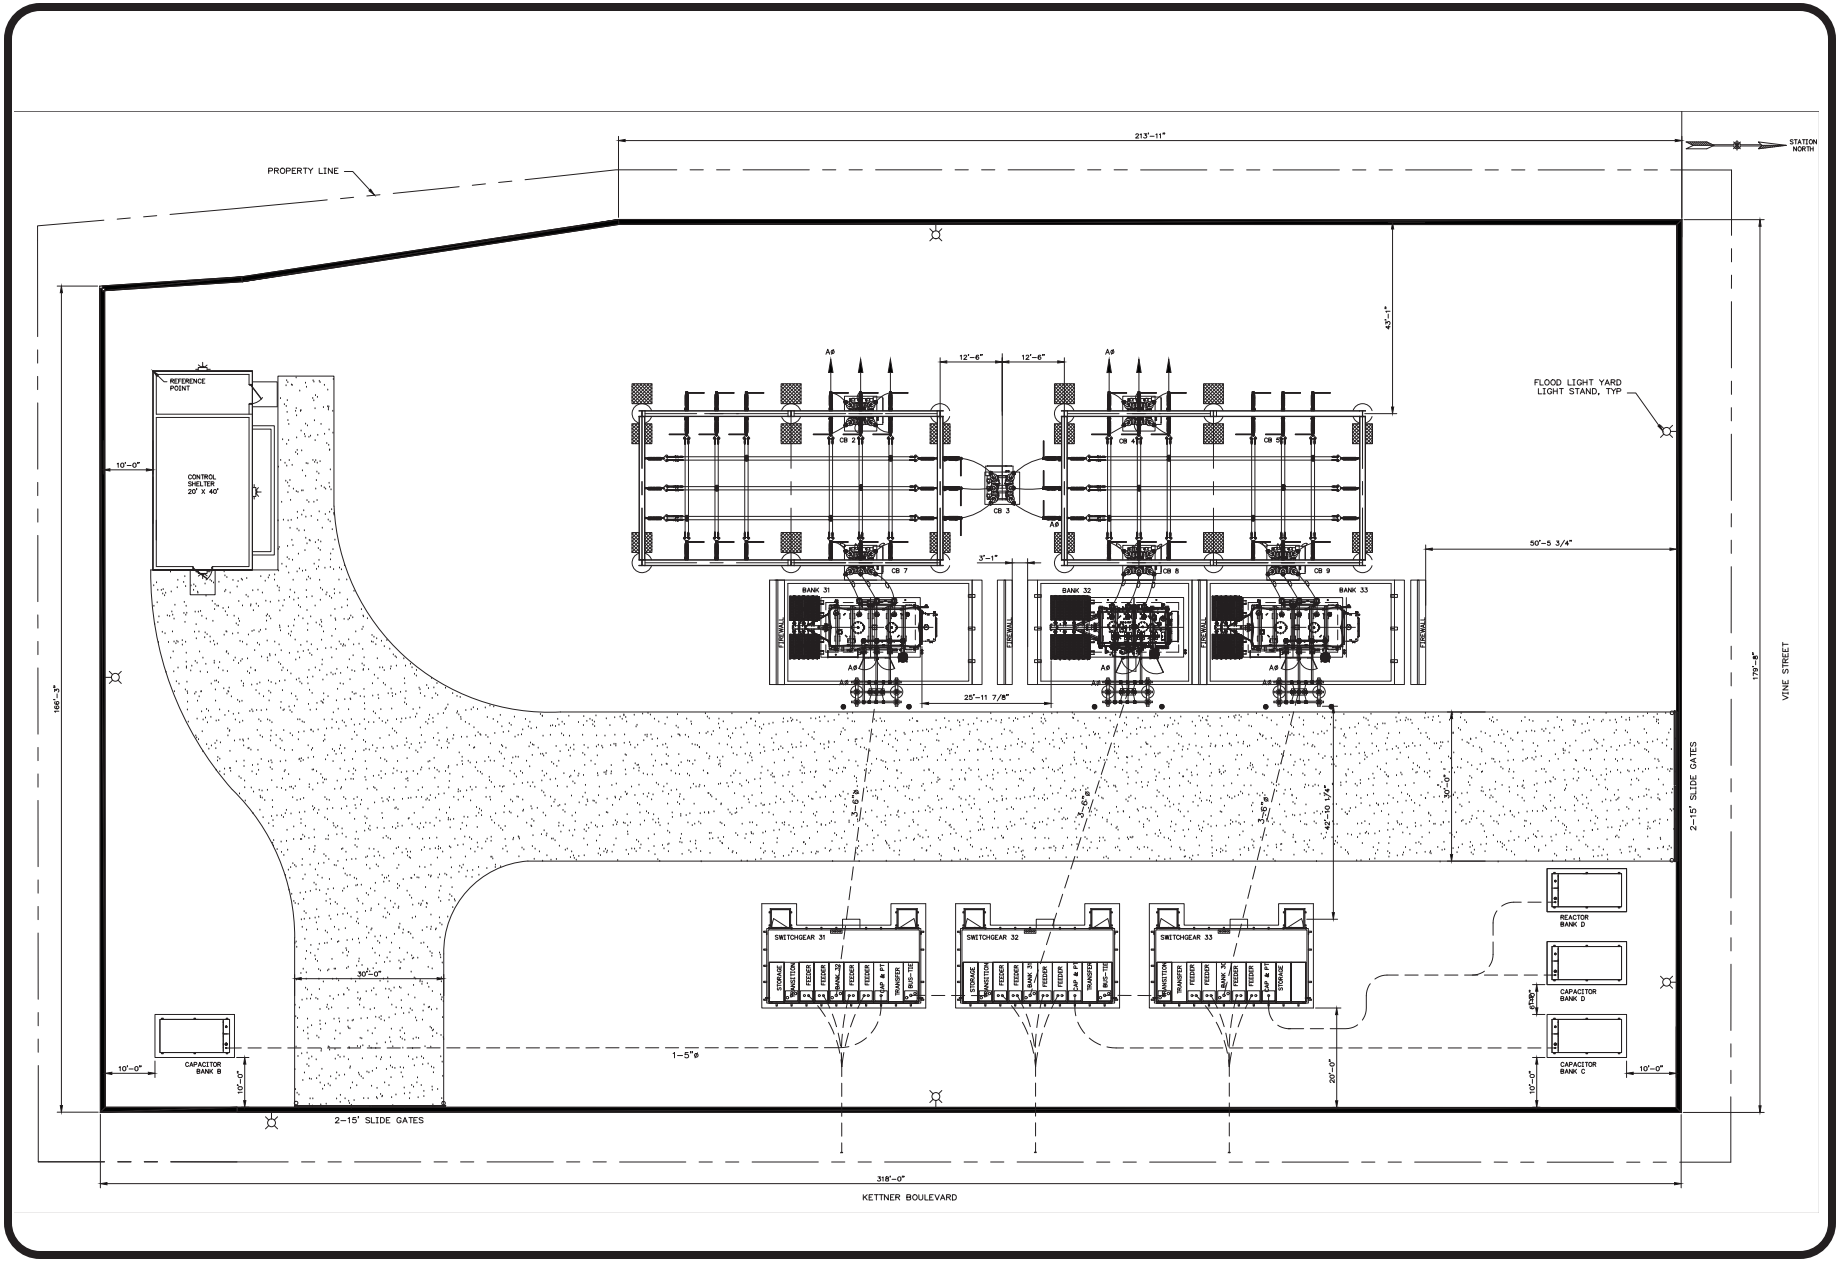

Figure 3-5: Vine Substation Initial Arrangement

SDGE
A Sempra Energy utility

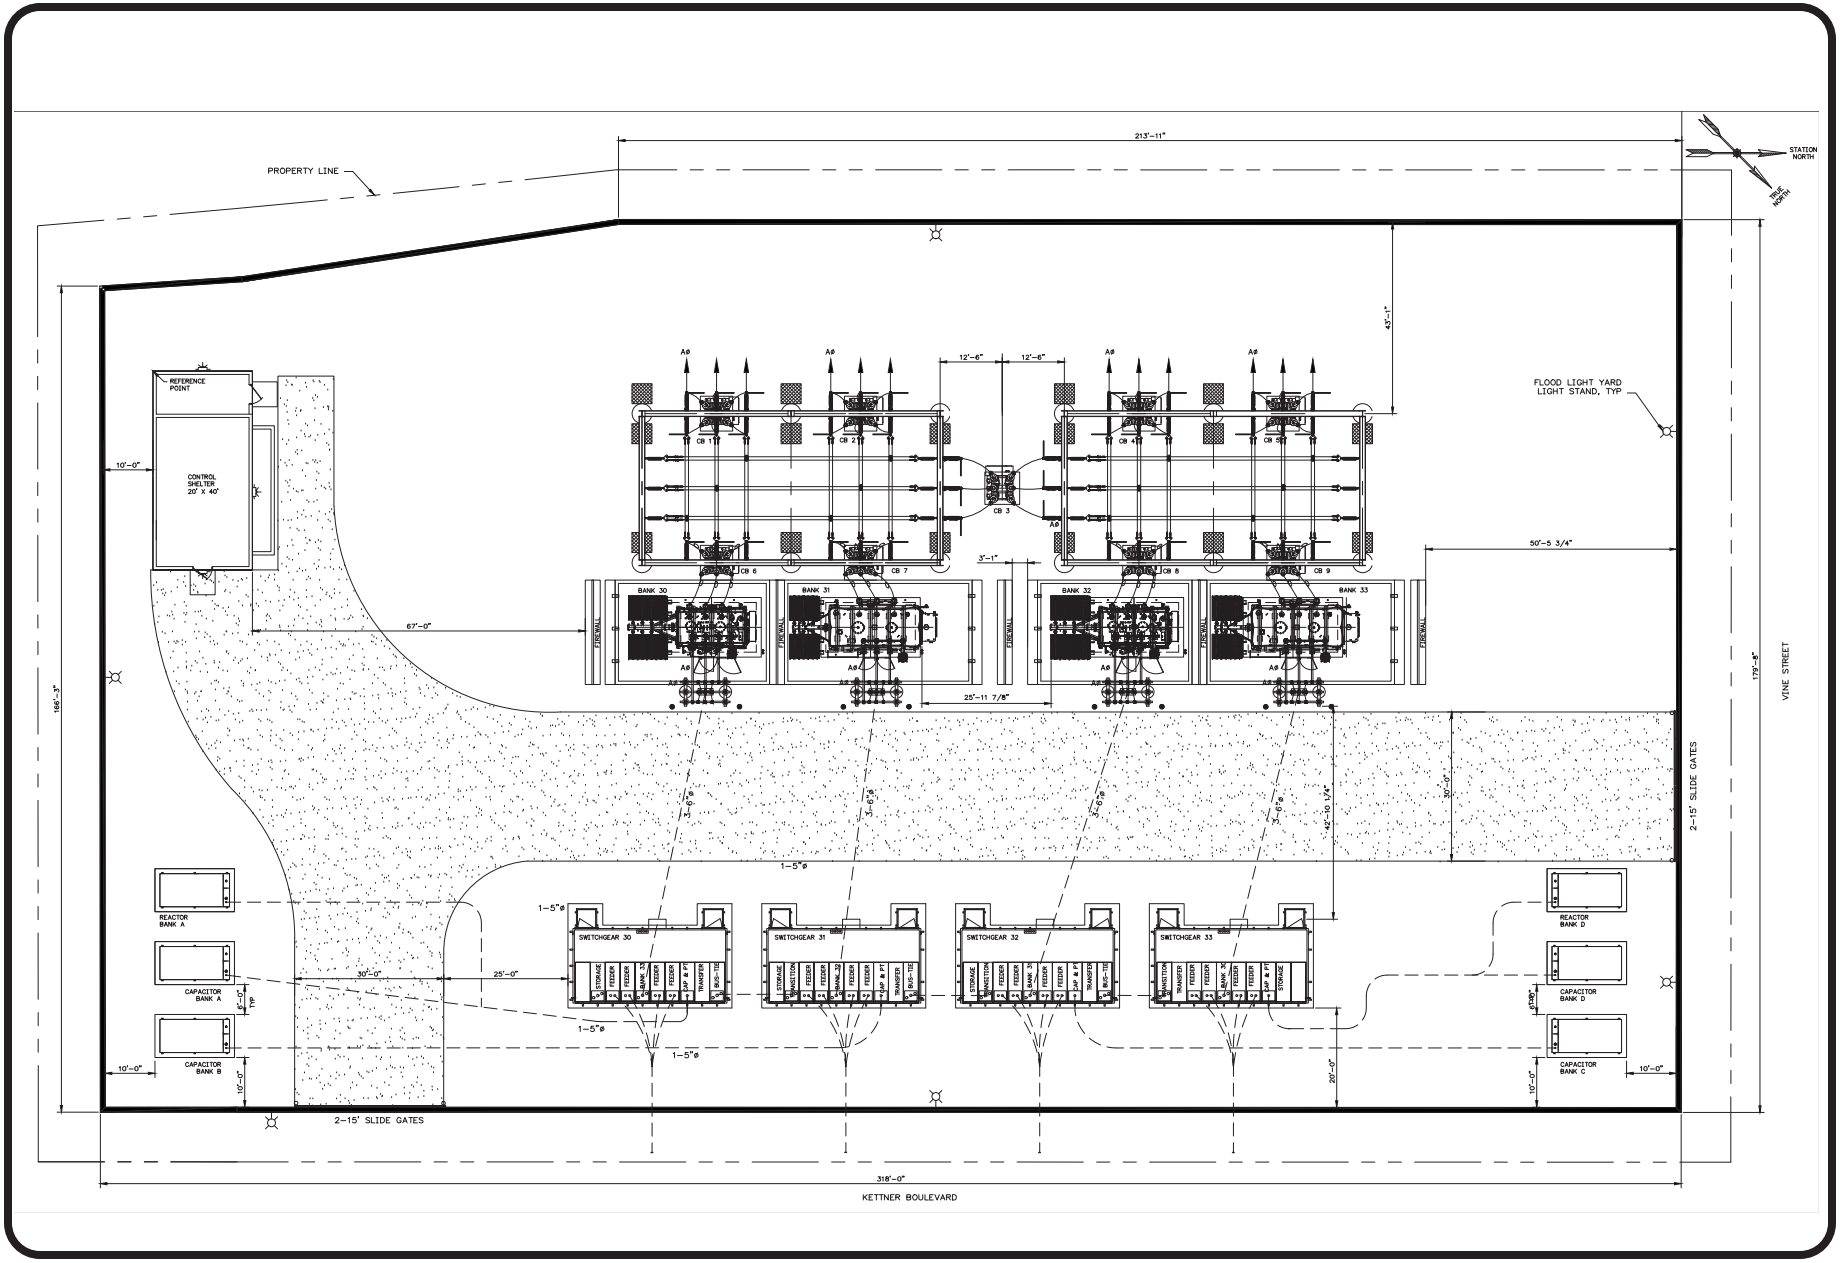

Figure 3-6: Vine Substation Ultimate Arrangement

SDGE
A Sempra Energy utility

The access road within the proposed Vine Substation will be asphalt-paved with an approximate width of 30 feet. The road will connect the primary and secondary access to the control shelter, located in the southern corner of the proposed Vine Substation. This interior road will be approximately 425 feet long, occupying approximately 0.3 acre. A detailed drawing—which depicts the proposed Vine Substation layout, planned access routes, driveways, and interior access road—is included as Figure 3-5: Vine Substation Initial Arrangement and Figure 3-6: Vine Substation Ultimate Arrangement. Figure 3-7: Vine Substation Profile View provides two profile views of the proposed substation.

3.4.1 12 kV Distribution Relocation

Underground Duct Bank

As described previously, approximately 3,900 feet of new underground duct banks will be installed to facilitate the relocation of eight distribution circuits from existing substations to the proposed Vine Substation. Each underground duct bank will be comprised of eight approximately five-inch-diameter polyvinyl chloride (PVC) conduits encased in concrete. The finished duct bank will be approximately 32 inches tall and 18 inches wide. A typical drawing of the proposed underground duct bank has been included as Figure 3-8: Typical 12 kV Underground Duct Bank. In addition to the underground duct banks, approximately five underground vaults will be installed to facilitate pulling and splicing during installation and inspection, maintenance, and repair during operation. The precast concrete vaults measure approximately 26 feet long, eight feet wide, and six feet deep. A typical drawing of the proposed 12 kV underground vaults has been included as Figure 3-9: Typical 12 kV Underground Vault. The proposed locations of these facilities are depicted in Attachment 3-A: Detailed Project Components Map.

Distribution Switches and Capacitors

Approximately nine aboveground distribution switches and one aboveground capacitor will be installed along the underground duct bank routes to facilitate the relocation of the distribution circuits. Each distribution switch will be installed on a concrete pad measuring approximately 70 inches long by 44 inches wide by 32 inches tall. The switches will be contained within a steel enclosure mounted atop the pad that will measure approximately 67 inches long by 41 inches wide by 50 inches tall. The single capacitor will be installed on a concrete pad, similar in size to those for the switches, and will measure approximately 60 inches long by 44 inches wide by 60 inches tall. Typical drawings of the concrete pad, switch, and capacitor have been included as Figure 3-10: Typical Switch and Capacitor Pad, Figure 3-11: Typical 12 kV Switch, and Figure 3-12: Typical 12 kV Capacitor. The proposed locations of these facilities are depicted in Attachment 3-A: Detailed Project Components Map.

Underground Cable

All underground distribution circuits will utilize 1,000 kcmil aluminum cross-linked polyethylene insulation (XLPE) cables.[3] The distribution getaways—located between the proposed Vine Substation and the two adjacent underground vaults located in Kettner Boulevard—will contain 1,000 kcmil copper XLPE cables.

3.4.2 69 kV Loop-In

Poles

As described previously, SDG&E is proposing to loop the existing double-circuit TL604 into the proposed Vine Substation. This will require the removal of two approximately 70-foot-tall, directly buried, dead-end wood pole; the removal of one approximately 28-foot-tall, self-supported stub guy pole; and the installation two new, approximately 100-foot-tall, self-supported, dead-end TSPs.[4] These new poles range in diameter from five to seven feet at the base and two to three feet at the top. The new TSPs will be equipped with six dead-end insulators to carry the three bundled conductors from the existing steel poles to the proposed Vine Substation. One existing wood distribution pole will also be replaced by a new approximately 100-foot-tall self-supported TSP. The replacement TSP will be equipped with six insulators to support the 69 kV conductors. Typical drawings of the existing wood pole, stub guy pole, and new TSPs have been included as Figure 3-13: Typical Existing 69 kV Wood Pole, Figure 3-14: Typical Existing Stub Guy Pole, and Figure 3-15: Typical Proposed 69 kV Tubular Steel Pole.

Overhead Conductor

TL604 is currently configured as a bifurcated-circuit (two conductors per phase) power line, where six individual conductors are supported by the associated poles. To facilitate the loop-in of this power line, these six conductors will travel from the existing and replacement steel poles to the new TSPs. From each new TSP, three individual conductors will traverse the railroad tracks and terminate within the substation. TL604 currently utilizes 1,033 kcmil aluminum-clad steel reinforced (ACSR) conductor, and the new loop-in will also use 1,033 kcmil ACSR. The overhead span lengths between poles will vary, but will generally be between 100 and 300 feet. The distance from the ground to the lowest conductor will be at least 35 feet, and the conductors' vertical spacing will be approximately nine feet. As described in Section 3.4.3 Telecommunication System, fiber optic telecommunication cables will also be collocated on the 69 kV loop-in poles.

[3] kcmil (1,000 circular mils [cmils]) is a quantity of measure for the size of a conductor; kcmil wire size is the equivalent cross-sectional area in thousands of circular mils. A cmil is the area of a circle with a 0.001-inch-diameter.

[4] Dead-end structures are typically used in locations where the conductor alignment changes direction. This pole configuration can also be used at the end of a conductor pull section and/or in locations where additional ground clearance is required.

3.4.3 Telecommunication System Extension

As described in Section 3.0.3 Telecommunication System Extension, new fiber optic cable will be installed from an existing underground vault located on Pacific Highway to the proposed Vine Substation, and from the proposed Vine Substation to the Kettner Substation. The connection from Pacific Highway to the proposed Vine Substation will occur in an overhead configuration along the new power line ROW, while the connection between the proposed Vine Substation and Kettner Substation will occur via a new underground duct bank. This component is described further in the subsections that follow.

An existing AT&T telephone line will be upgraded and relocated from the existing service to the new substation. The connection will originate from one of three locations located along the perimeter of the proposed Vine Substation site as depicted in Attachment 3-A: Detailed Project Components Map. The final location of the telephone line connection will be determined during final engineering and through additional coordination with AT&T.

Underground Duct Bank

As part of the 12 kV distribution relocation, approximately 2,850 feet of new underground duct banks will be installed along Kettner Boulevard between the proposed Vine Substation and Kettner Substation. Approximately 100 additional feet of new underground duct bank will be installed between an existing handhole located within Pacific Highway and one of the new TSPs that will be installed as part of the 69 kV loop-in. These underground duct banks will include two additional four-inch diameter PVC conduits as depicted in Figure 3-8: Typical 12 kV Underground Duct Bank. In locations where this duct bank will enter 12 kV underground vaults, a separate underground duct bank, comprised of two four-inch-diameter PVC conduits encased in a slurry mixture, will be used to route the telecommunication cable separate from the distribution vaults. This separate underground telecommunication duct bank will be approximately three feet tall and 1.5 feet wide. A typical drawing of the proposed underground duct bank has been included as Figure 3-16: Typical Telecommunication Underground Duct Bank. In addition to the underground duct banks, approximately four underground handholes will be installed to facilitate pulling and splicing during construction and inspection, maintenance, and repair during operation. These precast concrete handholes measure approximately 44 inches long, 32 inches wide, and 24 inches deep. A typical drawing of the proposed telecommunication handhole has been included as Figure 3-17: Typical Telecommunication Underground Handhole. The proposed locations of these facilities are depicted in Attachment 3-A: Detailed Project Components Map.

Underground and Overhead Cable

The telecommunication system extension will utilize all dielectric self-supporting-48 fiber optic cable that measures approximately 0.685 inch in diameter.

3.5 RIGHT-OF-WAY REQUIREMENTS

As described previously, SDG&E currently owns the approximately 1.5-acre parcel on which the proposed Vine Substation will be constructed; therefore, no new ROW will be required to install this Proposed Project component. Because the new and relocated 12 kV distribution circuits and

underground portions of the telecommunication system extension will be placed entirely within City of San Diego public streets, they will occupy the francise position and no new ROW will be obtained. SDG&E will obtain a License Agreement from MTS for the approximately 80 feet of new, approximately 320-foot-wide ROW for the overhead 69 kV loop-in conductors. The remainder of the 69 kV loop-in will be installed within the francise position of City of San Diego public streets.

3.6 CONSTRUCTION

This section describes the required access, anticipated temporary workspace requirements, and methods that will be employed to construct the facilities of the Proposed Project.

3.6.0 Staging Areas

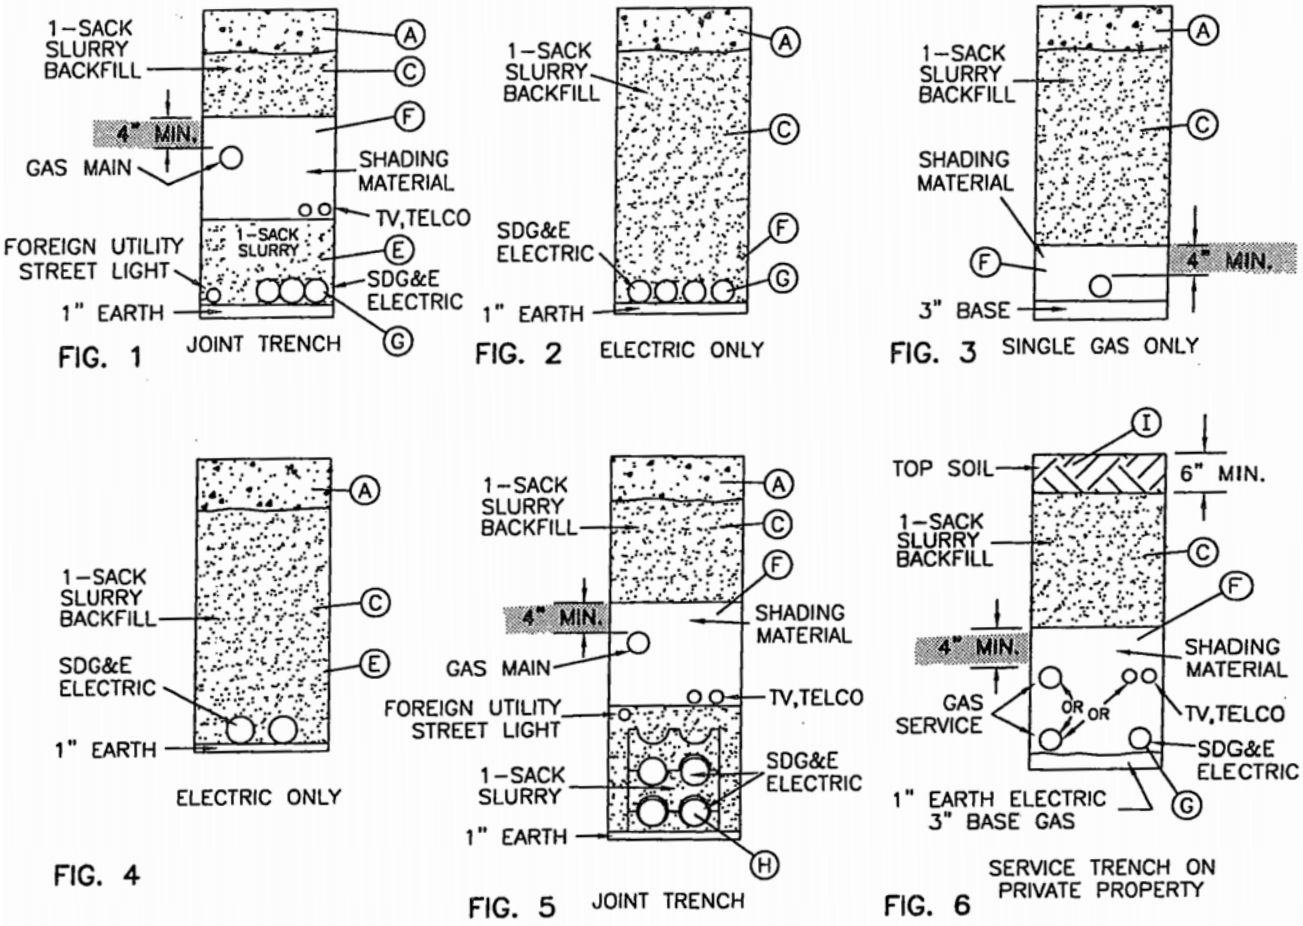
The majority of construction equipment, vehicles, personnel, and material staging areas will be accommodated within the property lines of the proposed substation property and within the work areas described in Section 3.6.1 Work Areas. Equipment staging will also be conducted at existing SDG&E facilities. Because each of these staging areas is currently used by SDG&E for other projects, no additional improvements at these sites will be required prior to construction. Additional existing SDG&E facilities or disturbed areas may be identified for use following the completion of final engineering. Temporary parking of some vehicles along Vine Street may be required depending on actual construction activities occurring at the proposed Vine Substation.

3.6.1 Work Areas

In addition to the staging areas discussed in the previous section, temporary workspace will be required for each Proposed Project component in order to facilitate construction. These anticipated workspace requirements are described in detail in the following subsections, summarized in Table 3-2: Temporary Workspace Requirements, and depicted in Attachment 3-A: Detailed Project Components Map. Temporary work areas will all be accessed by construction equipment using existing access roads, except for a small area to be cleared and graded for the 69 kV loop-in, which may require access by overland travel. All work areas will be restored to pre-construction conditions to the extent practical following the completion of construction. Further discussion of the restoration process is provided in Section 4.4 Biological Resources. Because the new telecommunication system facilities will be installed adjacent to the proposed distribution circuits or will be collocated with the overhead 69 kV loop-in, minimal additional workspace will be required.

Proposed Vine 69/12 kV Substation

As described previously, the majority of construction equipment, vehicles, personnel, and material staging will be accommodated within the property lines of the proposed Vine Substation site. The substation pad will be utilized for staging materials and equipment used in the construction of the substation facilities. Because the site is currently paved, no clearing of vegetation will be required for construction. Six palm trees located along Kettner Boulevard will be removed during the site preparation activities. The proposed Vine Substation will include adequate space for equipment, materials, temporary office trailers, and most—if not all—vehicle parking.



INSTALLATION:

(A) ALL TRENCH RESURFACING SHALL BE DONE ACCORDING TO GOVERNMENTAL AGENCIES REQUIREMENTS.

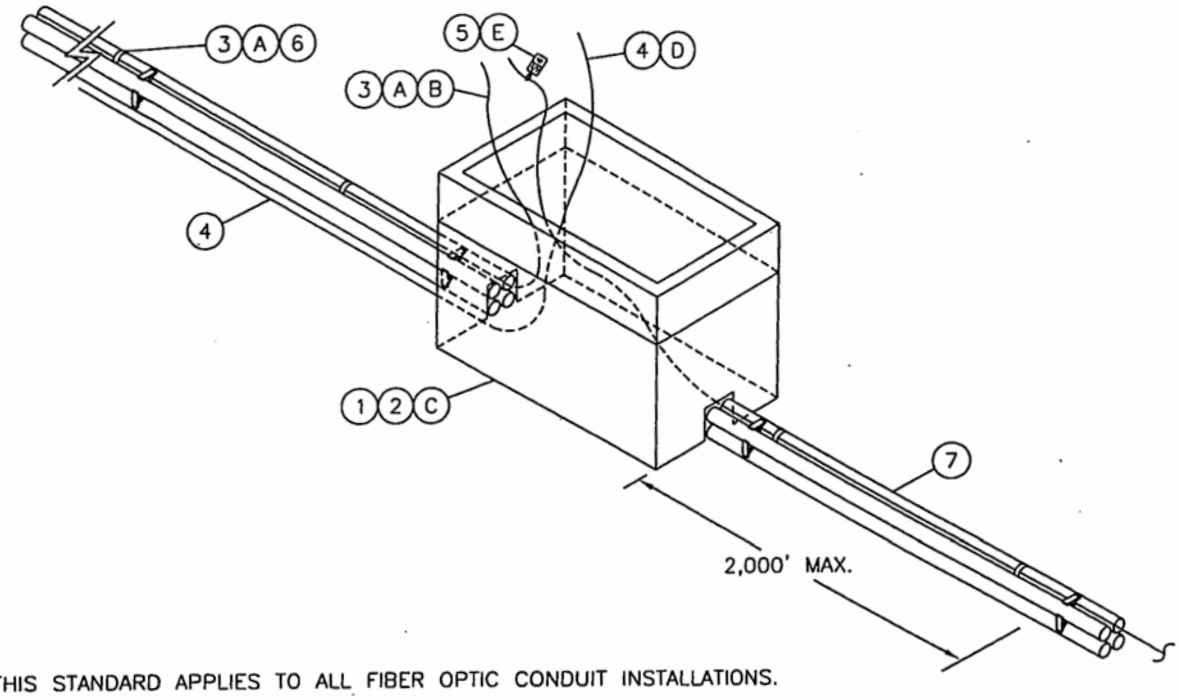
B. SHADING MATERIAL SHALL MEET GAS STANDARD 7405 OR UNDERGROUND 3370/3371 SPECIFICATIONS AND MUST BE APPROVED BY AN SDG&E AUTHORIZED INSPECTOR.

(C) BACKFILL MATERIAL SHALL MEET THE GOVERNMENTAL (PERMITTING) AGENCIES REQUIREMENTS AND SDG&E STANDARDS. THE SAND USED FOR THE ONE SACK SLURRY OR TWO SACK, IF REQUIRED BY GOVERNMENTAL AGENCIES, MUST MEET THE CONCRETE SAND SPECIFICATION LISTED IN THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION (GREEN BOOK) AND CONTAIN NO GRAVEL. SLURRY MUST BE FIRM BEFORE A PAVEMENT CONCRETE CAP IS INSTALLED. SLURRY IS TYPICALLY USED FOR BACKFILLING AROUND SUBSTRUCTURES, UNDER EQUIPMENT PADS, FOR TRENCHES IN EXISTING PAVED AREAS, AND UNDER CONCRETE OR PAVED DRIVEWAYS.

IT MAY NOT BE APPROPRIATE TO USE ONE SACK SLURRY UNDER THE THE FOLLOWING CIRCUMSTANCES:

- GOVERNMENTAL AGENCIES DO NOT ALLOW ONE SACK OR MAY REQUIRE TWO SACK SLURRY BACKFILL.
- INACCESSABILITY OF CONCRETE TRUCKS DELIVERING SLURRY.
- WHEN SLURRY IS NOT COST EFFECTIVE.
- NEW RESIDENTIAL SUBDIVISIONS, SINGLE FAMILY RESIDENCE SERVICE TRENCH
- SHALLOW WELD HOLES, POT HOLES, ETC.

Figure 3-16: Typical Telecommunication Underground Duct Bank



NOTE:

– THIS STANDARD APPLIES TO ALL FIBER OPTIC CONDUIT INSTALLATIONS.

– REFER TO THE SPECIFIC TRANSMISSION PROJECT FOR INSTRUCTIONS ON THE USE OF TRACER WIRE IN THE TRANSMISSION TRENCH.

II. ALLATION:

(A) YELLOW TRACER WIRE SHALL BE INSTALLED IN THE TRENCH ALONGSIDE CONDUIT WHICH IS DESIGNATED FOR FIBER OPTIC CABLE. THE WIRE SHALL BE TAPED TO THE CONDUIT 8 TO 10 FOOT INTERVALS.

(B) THE TRACER WIRE SHALL BE LOOPED INSIDE THE HANDHOLE WITH ENOUGH SLACK TO EXTEND 12" BEYOND THE TOP OF THE BOX. CUT THE TRACER WIRE, SEAL AND TAPE THE ENDS.

(C) LOCATE ACCESS POINTS (HANDHOLES) TO THE TRACER WIRE AT 2000' INTERVALS.

(D) EXTEND GROUND WIRE 12 INCHES BEYOND THE TOP OF BOX.

(E) ATTACH AN "S4" TAG TO ALL TRACER WIRE AT ACCESS POINTS.

Figure 3-17: Typical Telecommunication Underground Handhole

Table 3-2: Temporary Workspace Requirements

Proposed Project Component	Workspace Type	Required Improvements	Quantity	Approximate Dimensions (feet)	Total Approximate Area (acres)
Proposed Vine 69/12 kV Substation	Substation Pad Installation Area	Grading, excavation, boundary wall and gate installation, substation component installation, and driveway installation	1	340 by 190	1.48
12 kV Distribution Relocation	Underground Work Area	Excavation, duct bank installation, and cable installation	1	3,900 by 30	2.69
	Vault Installation Work Area	Excavation, vault installation, and cable installation	5	60 by 40 each	0.25
	Pull Site	None	2	50 by 30	0.07
	Switch and Capacitor Installation Work Area	Excavation and pad installation	10	50 by 30	0.34
69 kV Loop-In	Work Area	Excavation, and pole and foundation installation	1	225 by 55	0.28
		Pole and foundation removal	1	140 by 50	0.16
		Pole removal	1	100 by 50	0.11
		Pole removal and installation	1	130 by 50	0.15
		Conductor installation and removal	1	80 by 40	0.07
			1	70 by 40	0.07

Proposed Project Component	Workspace Type	Required Improvements	Quantity	Approximate Dimensions (feet)	Total Approximate Area (acres)
Telecommunication System Extension	Underground Work Area	Excavation, duct bank installation, and cable installation	1	625 by 30	0.43
	Handhole Installation Work Area	Excavation, handhole installation, and cable installation	4	50 by 30	0.14
Total	**--**	**--**	**--**	**--**	**6.24**

Note: This information is preliminary and subject to adjustment based on final engineering, ground conditions at the time of construction, and other factors. The total workspace area required will be less than the total indicated due to overlapping workspaces.

12 kV Distribution Relocation

The installation of new duct banks and vaults will require temporary workspace within Kettner Boulevard. The underground trench work area will be approximately 20 to 30 feet wide and will be generally centered on the distribution circuit alignments. The underground trench work area will be adjusted to comply with traffic control permits to maintain traffic flow through construction areas as necessary. In locations where vaults will need to be installed, additional workspace will be established and will measure approximately 150 feet by 25 feet centered on the vault location. All trenching and vault work areas will be located within City of San Diego streets and public areas. These work areas will also support all cable installation activities, as well as the associated construction equipment to perform the work. A total of approximately 6,460 linear feet of workspace, which requires approximately 4.45 acres, will be established prior to construction. Site preparation for an underground trench work area and vault installation work areas will involve a survey mark out with offsets of the proposed trench alignment, as well as setting up traffic controls prior to construction. Additional temporary work spaces measuring approximately 50 feet by 30 feet will be established to facilitate the installation of switches and capacitors.

The cable installation process will require a network of pull sites located adjacent to the proposed and existing underground vaults. These pull sites will be approximately 50 feet long by 20 to 30 feet wide. With the exception of the two pull sites that will be established near the intersections of Kettner and West Hawthorn Street and Pacific Highway and West Hawthorn Street, all pull sites will be located within the underground trench work area. All pull sites will be located within the paved portion of existing City streets; therefore, no improvement will be required prior to use.

69 kV Loop-In

To accommodate construction equipment and activities during the removal of the existing wood power line pole and associated guy pole, an approximately 150-foot-long by 40-foot-wide temporary workspace will be established along Vine Street. A second work area, approximately 100 feet long by 40 feet wide, will be established along California Street to remove a second wood pole. Because the poles are located within the existing sidewalk, no grading or vegetation removal is anticipated.

In order to install the three new poles that will facilitate the loop-in of TL604, two additional work areas will be established. The first will measure approximately 250 feet long by 55 feet wide and will be placed along Pacific Highway. The work area will be located directly adjacent to the existing fence that separates Pacific Highway from the existing railroad ROW. As a result, up to two lanes of traffic along the northbound direction of Pacific Highway will be closed during installation of the new poles and during conductor installation and removal activities. The existing vegetation within this pole work area may be cleared to establish safe operating conditions for construction equipment. The second work area will be located adjacent to the existing distribution pole. This work area will be used to facilitate the installation of a new power line pole for the 69 kV loop-in. This work area will measure approximately 130 feet long by 50 feet wide and will be placed within an existing parking lot along Pacific Highway.

Conductor installation and removal will require two additional work areas. The first work area will be located along Frontage Road and will measure approximately 80 feet long by 40 feet wide. The second work area will measure approximately 75 feet long by 40 feet wide. The work area will be located along Pacific Highway.

3.6.2 Access

Access to the proposed Vine Substation will be accomplished from Vine Street during construction via the relocated driveway. Access to the 69 kV loop-in will primarily occur from Vine Street, California Street, and Pacific Highway. The 12 kV distribution relocation activities will be accessed from Kettner Boulevard. As described previously, secondary access to the proposed Vine Substation will be from Kettner Boulevard for use during operation and maintenance activities. No new permanent access roads will be constructed.

3.6.3 Methods

Construction methods for the proposed Vine Substation, 12 kV distribution relocation, and 69 kV loop-in are described in this section. The methods used to extend the telecommunication system are similar to those that will be used to relocate the 12 kV distribution circuits. As a result, they are not discussed further. Refer to Section 4.6 Hazards and Hazardous Materials for information regarding handling and disposal of contaminated materials. A summary of the number of truck trips required to construct each of the Proposed Project's components has been provided as Table 3-3: Construction Truck Trip Summary.

Table 3-3: Construction Truck Trip Summary

Proposed Project Component	Approximate Truck Trips Required
Proposed Vine 69/12 kV Substation	2,650
12 kV Distribution Relocation and Telecommunication System Extension	1,350
69 kV Loop-In	400

Proposed Vine 69/12 kV Substation

Site Development

Site development activities will commence with the removal of the existing paved parking lot surface, which will require the use of excavators, front-end loaders, concrete saws, and/or bulldozers. Once cleared, remedial grading will take place based on the recommendations of the geotechnical investigation, which will determine the appropriate on-site pad elevation and foundation support that also maintains adequate site drainage. On-site material will be reused to the extent possible, as recommended by a Geotechnical Engineer. These activities are anticipated to generate approximately 4,200 cubic yards (CY) of material for off-site disposal. Approximately 4,600 CY of select fill will be imported to help achieve the conceptual design elevation. Site grading will be accomplished primarily with bulldozers and backhoes, which will condition, cut and fill, and blend the native soil and imported material to the desired pad elevations.

Construction of the boundary walls will begin once grading is complete. At this time, an approximately 12-inch layer of Class II aggregate base (approximately 2,100 CY) will also be installed over the building pad area for the finished surface.

Construction of the proposed Vine Substation will require approximately 6,700 CY—or an estimated 1,470 haul truckloads—of imported fill to develop the proposed substation site. Haul trucks will operate periodically, as needed, during the grading phase of construction. In general, an average of no more than 20 truck trips per day for an estimated five months will be required to complete the proposed substation grading and boundary wall installation. In addition, approximately five additional trips per day are anticipated for the delivery of materials and equipment for the duration of construction.

Below-Grade Construction

Following site development, below-grade work will begin, which will inclue the construction of structure and equipment foundations, underground ducts, the ground grid, and erection of the control shelter. The construction of the distribution circuits and tie lines surrounding proposed Vine Substation will start while the substation is under construction. Concrete trucks, backhoes, ditch-witches, and skid steer loaders will be used for the below-grade work.

Above-Grade Construction

Once the grading activities and below-grade construction are complete, major equipment and structures will be installed and anchored on their respective foundations. The following steps will be taken to install the above-grade equipment:

- The 69 kV rack will be erected.
- The 69 kV circuit breakers will be installed on their foundations.
- The control shelter will be constructed, and relay panels, controls, battery, and station lighting and power will be installed.
- The ground grid, control, communication, and power ducts will be installed and wiring of the equipment controls and protection devices will follow.
- The 69/12 kV transformers will be installed on their foundations, assembled, and filled with oil.
- The 12 kV switchgear, capacitors, and reactor will be installed on their foundations.

Power lines and distribution circuits will be completed and connected inside the substation following final installation of the substation structures and equipment. Communication equipment, will be connected inside the control shelter. Testing will be performed on all equipment after the equipment is installed and wired, and before placing it in service. Equipment will be placed in service once the 12 kV circuits and 69 kV loop-in are ready to be energized and are tested outside the substation.

Portable cranes and heavy hauling trucks will be employed to bring in the 69/12 kV transformers. Substation crews, assist vehicles, forklifts, man lifts, and boom trucks will be used to construct the substation. Oil-processing equipment and vacuum pumps will be used to fill transformers with oil. Pickup trucks and vans will be used for the wiring and control testing of

the substation equipment. Line trucks, assist vehicles, and cable dolly trailers will be used for construction of the power line and distribution circuits.

A temporary tap to an existing distribution line may be installed to provide electrical service to the substation staging area during construction. This temporary tap may be used to power construction trailers, lighting, or small hand-held machinery or tools until the substation is energized. The temporary tap may require up to three directly buried wood poles (approximately 20 feet in height) to connect a distribution line from an existing underground distribution transformer located adjacent to the substation site.

Cleanup and Post-Construction Activities

All areas that are temporarily disturbed during construction activities will be restored to pre-construction conditions, to the extent practicable, once construction of the substation is complete. Cleanup efforts will include removal of all construction debris for recycling and/or disposal off site. In addition, landscaping will be installed consistent with SDG&E's Landscape Plan, which is described further in Section 4.1 Aesthetics.

12 kV Distribution Relocation

Trenching

Prior to trenching, other utility companies will be notified to locate and mark existing underground utilities along the proposed underground alignment. Exploratory excavations (i.e., potholing) will also be conducted to verify the locations of existing facilities in the ROW. Coordination with the City will also occur in order to secure encroachment permits for trenching in the City's ROW, as required. It is anticipated that between one and two lanes of Kettner Boulevard will occasionally be closed during trenching activities. During these closures, traffic controls will be implemented as required by the Encroachment Permit.

Trenching operations will be staged in intervals so that only a maximum of 500 feet of trench will be left open at any one time, or as allowed by permit requirements. The fill generated by excavation activities will be transported to an SDG&E approved disposal site. At any one time, open trench lengths will not exceed that required to facilitate the installation of the duct bank. Steel plating will be placed over the trenches to maintain vehicular and pedestrian traffic across areas that are not under active construction. A typical drawing of the proposed underground construction activities has been included as Figure 3-18: Typical Underground Construction Process within Roadways.

The duct bank will be installed using open-cut trenching techniques. Most of the duct bank will have a single-circuit vertical configuration, as shown in Figure 3-8: Typical 12 kV Underground Duct Bank. Transitions to a flat configuration may be required in certain areas to clear substructures in highly congested areas, or to fan out to termination structures at the transition area.

The typical trench dimensions for installation of each duct bank will be three to six feet deep and two to seven feet wide, depending on the duct bank configuration. Depths may vary depending on soil stability and the presence of existing substructures. The trench will be widened and shored where necessary to meet California Occupational Safety and Health Administration

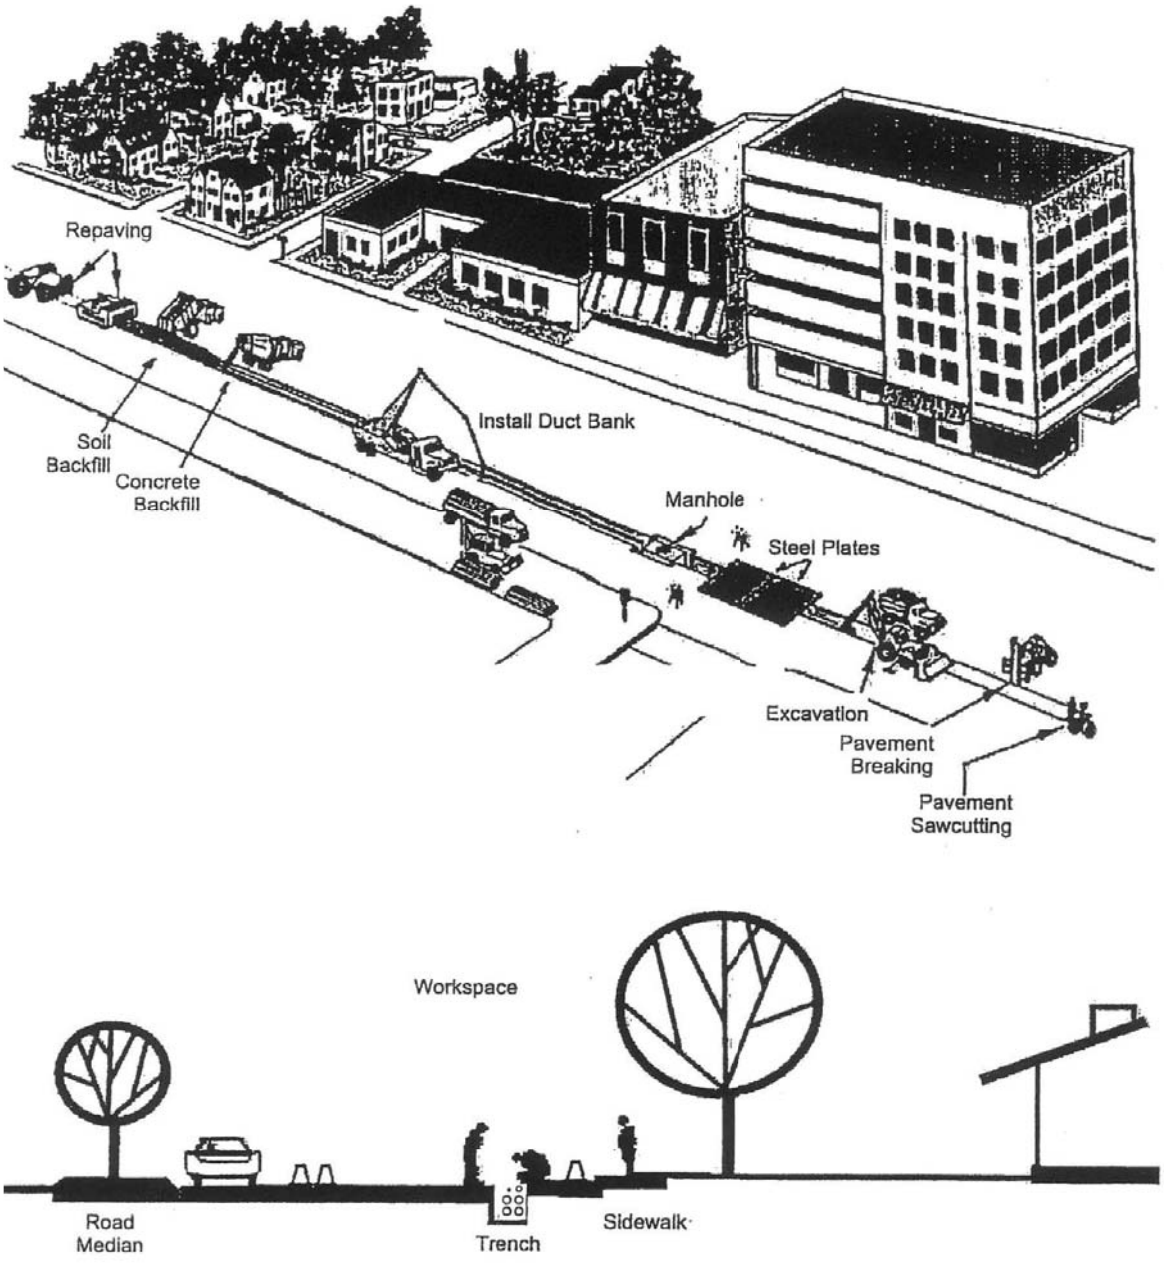


Figure 3-18: Typical Underground Construction Process within Roadways

requirements. If trench water is encountered, trenches will be dewatered using a portable pump and the water will be disposed of in accordance with acquired permits.

As described previously, traffic controls will also be implemented to direct local traffic safely around work areas. SDG&E will coordinate provisions for emergency vehicle and local access with local jurisdictions as necessary.

Duct Bank Installation

As the trenches for the underground 12 kV duct banks are completed, SDG&E will install the cable conduits (separated by spacers) and pour concrete around the conduits to form the duct banks. The duct banks will typically consist of eight five-inch-diameter PVC conduits, which house the electrical cables. The dimensions of the duct banks will be approximately 1.5 feet wide by 2.7 feet tall for a vertical configuration. The duct package will consist of a single 12 kV distribution circuit. As described previously, two four-inch conduits will be installed within the distribution duct bank between the proposed Vine substation and Kettner Substation for telecommunication purposes.

Once the PVC conduits are installed, engineered slurry backfill will be imported, placed, and compacted. A road base backfill or slurry concrete cap will be installed and the disturbed road surface will be restored in compliance with local permits. While the completed trench sections are being restored, additional trench will be opened farther down the street. This process will continue until the distribution circuits are completed. Each duct bank will have a minimum of 30 inches of cover. Larger trenches will be excavated where vaults are installed, as described in the subsection that follows.

Where the distribution duct bank will cross other substructures that operate at normal soil temperature (e.g., gas lines, telephone lines, water mains, storm drains, and sewer lines), a minimal radial clearance of 12 inches will be required. In instances where the duct bank will be installed parallel to other substructures, a minimum radial clearance of 24 inches will be required. Ideal clearances of two to five feet are preferred. Where the duct banks cross or run parallel to substructures that operate at temperatures significantly exceeding normal soil temperature (e.g., other underground power line circuits, primary distribution cables, steam lines, and heated oil lines), additional radial clearance may be required. All work will be done in conformance with SDG&E's current construction and operating practices.

Vault Installation

SDG&E will excavate and install pre-formed concrete splice vaults during trenching for the 12 kV circuit duct banks. The proposed trench alignment and vault locations are shown on Figure 3-2: Project Overview Map. The installation of each vault will require an excavation measuring approximately 11 feet by 7.5 feet by 29 feet. Initially, the vaults will be used to pull cable through the conduits and splice the cables together during construction. During operation, the vaults will provide access to the underground cables for maintenance, inspections, and repairs.

Vaults will be constructed of prefabricated, steel-reinforced concrete and designed to withstand the maximum credible earthquake in the area and traffic loading. The installation process for each vault will occur over a one-week period, beginning with the excavation and shoring of the

vault pit, followed by delivery and installation of the vault, filling and compacting the backfill, and repaving the excavated area where necessary.

Cable Pulling, Splicing, and Termination

After installation of the conduit, SDG&E will install three cables per distribution circuit in the duct banks. Each cable segment will be pulled into the duct bank, spliced at each of the vaults along the route, and terminated at the proposed Vine Substation. To pull the cable through the ducts, a cable reel will be placed at one end of the section and a pulling rig will be placed at the other end. A larger rope will then be pulled into the duct using a pull line and will be attached to the cable-pulling eyes to pull the cable into the duct. A lubricant will be applied to the cable as it enters the duct to decrease friction during pulling. The electric cables and the communication cable will be pulled through the individual ducts at the rate of two or three segments between vaults per day.

The vaults must be kept dry at all times to keep the unfinished splices dry and prevent other impurities from affecting the cables. Splicing typically takes 12 to 16 hours per day to complete. At each end of the underground segment, the cables will rise out of the ground and terminate within the substation.

Cleanup and Post-Construction Restoration

All areas that are temporarily disturbed by the 12 kV distribution relocation activities will be restored to pre-construction conditions, to the extent practicable, following completion of construction. Restoration will involve the removal of all construction debris for recycling or disposal off site and repaving, as appropriate.

69 kV Loop-In

Clearing and Grading

Because the power line poles will be located adjacent to Pacific Highway, minimal grading and vegetation removal are anticipated. If vegetation removal is required, mowers will be used to clear the area required for pole installation. Material removed during the process or the subsequent excavation will be spread over the existing area as appropriate, or will be disposed of off site in accordance with all applicable laws. The vegetation and habitat communities that exist at the potential clearing sites are discussed in Section 4.4 Biological Resources. Access to the temporary work area will be provided by overland travel from California Street and Vine Street within the newly acquired ROW.

Steel Pole Installation

Foundations

The three steel poles that will be installed as part of the Proposed Project will be placed on new concrete foundations, consisting of drilled concrete piers. Following the preparation of the pole work areas, the foundation process will begin with the excavation of a hole using a truck-mounted excavator with augers of various diameters to match the diameter and depth requirements of the foundation.

Each foundation hole will measure approximatey nine feet in diameter and approximately 40 feet deep, requiring the excavation of 95 CY of soil, depending on the conditions. Following the excavation of the foundation hole, a reinforcing steel cage and anchor bolts will be assembled at one of the Proposed Project's staging areas, transported to the foundation site, and installed. Following the cage installation, a form will be built and concrete will be poured to a height of approximately two feet above grade. Each foundation will require approximately 80 CY of concrete to be delivered to the foundation location. Concrete will be delivered directly to the pole's location in concrete trucks with a capacity of up to 12 CY. Steel plating will be placed over excavated areas, where appropriate, to maintain vehicular and pedestrian traffic.

Pole Installation

Steel poles will be delivered in one or more sections to the pole site via flatbed truck and assembled on site using a small, truck-mounted crane. The poles will typically have three crossarms, supporting one circuit on one side of the pole. The crossarms will be bolted to the pole, and the insulators will be bolted to the crossarms. After assembly, a large crane will be used to lift and set the poles into place on the anchor bolts embedded in the concrete foundation. The nuts on the foundation will then be tightened and secured.

Overhead Conductor Installation

Conductor-stringing operations will be facilitated with the installation of sheaves or "rollers" on the structure crossarms during structure installation, using aerial manlifts (e.g., bucket trucks). The sheaves will allow the conductor to be pulled through each structure until the entire line is ready to be pulled up to the final tension position. Following installation of the sheaves, a sock line (i.e., a small cable used to pull the conductor) will be pulled onto the sheaves using a helicopter. Once the rope is in place, it will be attached to a steel cable and pulled back through the sheaves. The conductor will then be attached to the cable and pulled back through the sheaves using conventional tractor-trailer pulling equipment located at the pull site. This process will be repeated for each conductor.

The work areas located along Pacific Highway will be used to facilitate the pulling activities. These work areas will be used to load the tractors and trailers with reels of conductors, and the trucks with tensioning equipment. These sites will also be used to collect conductor after it is removed from the existing lines and placed onto reels for transport off site. Attachment 3-A: Detailed Project Components Map details the locations of the work areas.

After the conductor is pulled into place, the sags between the structures will be adjusted to a pre-calculated level. The line will be installed with a minimum ground clearance of 35 feet from the ground to the lowest conductor. The conductor will then be clipped into the end of each insulator, the sheaves will be removed, and vibration dampers and other accessories will be installed. This process will be repeated for each conductor. A typical drawing of the conductor installation procedure is provided as Figure 3-19: Typical Overhead Conductor Installation.

Wood Pole Removal

The existing wood pole removal will begin with crews dismantling the hardware on the existing poles using cranes and aerial manlifts. The old poles will then be cut off at ground level and

transported off site by flatbed truck for disposal at an approved facility. The base of the poles will be abandoned in place if they cannot be removed. If the base of the poles are removed, then the voids will be backfilled and compacted with native soil, and the surrounding area will be restored.

Steel Pole Removal

The existing steel guy pole and associated guy wires will be dismantled and removed by cranes and aerial manlifts. The pole and guy cables will be transferred to a flatbed truck using a small, truck-mounted crane. The material will then be transported off site for recycling or disposal at an approved facility. Once the pole has been removed, the associated reinforced concrete foundation will be jack-hammered to approximately 12 to 18 inches below grade. All debris located near the vicinity of the foundation will be removed from the site and will be recycled or disposed of at an approved facility. The remaining hole will then be backfilled with material similar to the surrounding area and the site will be restored.

Dewatering

No dewatering is anticipated during construction. However, in the event that groundwater is encountered, it will occur during construction of the duct bank, handhole installation for the relocated distribution circuits and telecommunication system extension, or foundation excavation for the 69 kV loop-in. Should dewatering be necessary, the following construction dewatering procedures will be implemented during construction:

- A submersible pump will be installed.
- The groundwater will then be pumped to a desiltation tank (i.e., baker tank) at one end for sediment and filtering. Baffles will be installed in the tank to increase sedimentation, and the water in the tank will be allowed to flow out from the opposite end for testing.
- The water will then be tested to ensure compliance with the Regional Water Quality Control Board (RWQCB) National Pollutant Discharge Elimination System requirements. If the water quality does not meet permit requirements, additional baker tanks will be used and/or additional treatment or filtering will be performed until the applicable requirements are met.
- The water will be disposed of at an approved SDG&E disposal site.

Cleanup and Post-Construction Restoration

With the exception of areas around all poles that will be kept clear of shrubs and other obstructions for inspection and maintenance purposes, all other areas that are temporarily disturbed will be restored to pre-construction conditions, to the extent practicable, following the completion of the 69 kV loop-in. Restoration will include grading to original contours, reseeding, and repairing the current pavement, as appropriate.

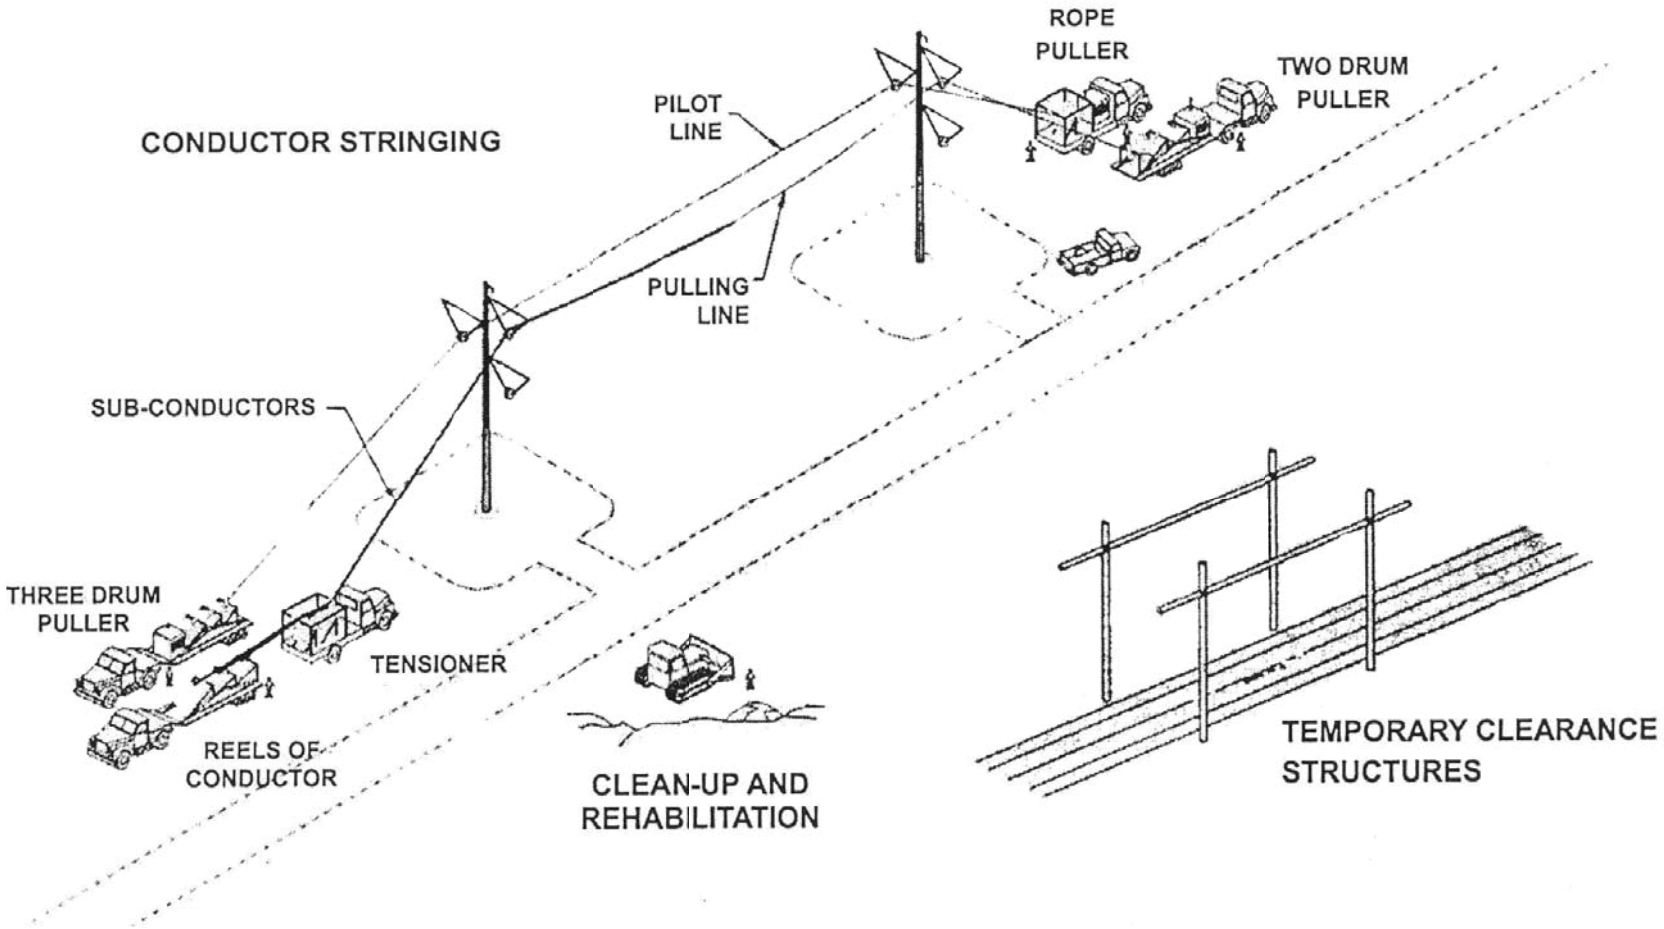

Figure 3-19: Typical Overhead Conductor Installation

3.6.4 Construction Equipment and Personnel

Construction equipment will include bulldozers, excavators, loaders, graders, and trucks for excavating, compacting, and hauling. All exported soil and new fill will be transported using street-legal dump/loader trucks. Concrete trucks, backhoes, ditch-witches, and skid steers will be used for the foundation and below-grade work. Portable cranes and heavy hauling trucks will be employed to bring in the 69/12 kV transformers. Substation crews, assist vehicles, forklifts, man lifts, and boom trucks will be used to construct the substation, along with pickup trucks and vans for the wiring and control testing of the substation equipment. Overhead and underground line trucks, assist vehicles, and cable dolly trailers will be used for the construction of the power line and distribution circuits. Table 3-4: Construction Equipment Requirements provides the anticipated construction equipment that will be used for each construction activity.

It is anticipated that up to 33 workers will be employed for the site development phase of the Proposed Project. Between 12 and 24 workers are expected during the foundation and below-grade work, as well as the construction of the proposed substation. The relocation of the 12 kV distribution circuits will require between 12 and 20 workers. Final testing and checkout will require nine electricians and/or engineers. A summary of the anticipated construction personnel by Proposed Project component has been included as Table 3-5: Construction Personnel Requirements.

3.6.5 Construction Schedule

Total construction time—including grading, construction, energizing and testing—is expected to take approximately 19 months, starting in January 2016. Substation construction will generally take place during normal work hours from Monday through Saturday. Due to the potential traffic impacts related to relocation of the distribution circuits, construction within Kettner Boulevard will occur during the evenings. In addition, some concrete pours may take place during an extended day, depending on the size of the pour. Transformer oil filling may also require vacuum pulls and oil installation, which in turn may require continuous work through the night. Actual cutovers of the power line and distribution circuits to the substation will be dependent on loading requirements and will be done in a manner that maintains uninterrupted service to customers. This may require part or all of this work to be done after normal business hours or on the weekend and/or nights. A detailed construction schedule has been included as Table 3-6: Proposed Construction Schedule.

3.7 OPERATION AND MAINTENANCE

3.7.0 Proposed Vine 69/12 kV Substation

Once the proposed Vine Substation is constructed and placed in service, it will be unmanned. The proposed Vine Substation will be monitored and controlled by SDG&E's Remote Control Center.

Ongoing maintenance will involve testing, monitoring, and repair of the equipment, as well as emergency and routine procedures to enable efficient provision of SDG&E services. As described previously, a boundary wall will be provided around the proposed Vine Substation and

Table 3-4: Construction Equipment Requirements

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Proposed Vine 69/12 kV Substation			
Site Development and Grading			
Scraper	Grade pads and access roads	7	4
Front-end loader	Load dump trucks and stockpile	6	2
Dump truck (12 CY)	Transport import/export material	7	25
Dozer (D6 or D8 or D9)	Grade pads and access roads	6	2
Excavator	Excavate and load materials	6	1
Water truck	Suppress dust	7	1
Compactor (824 or 834)	Compact soil	7	2
Skid steer loader	Move materials	3	2
Backhoe	Excavate and load materials	6	2
Ditch-witch	Excavate trenches	6	1
Maintenance truck	Maintain and refuel equipment	1	2
Paver	Pave access roads	6	1
Asphalt trucks	Deliver asphalt	1	8
Drum roller compactor	Compact access roads	6	2
Car/Pickup truck	Transport construction personnel	0	15
Retaining/Boundary Wall Construction			
Front-end loader (IT28)	Load dump trucks and stockpile	9	3
Excavator	Excavate and load materials	9	1
Water truck	Suppress dust	9	1

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Compactor (563 Ride-On)	Compact soil	9	1
Motor grader (blade)	Grade pads and access roads	9	1
Walk-behind compactor	Compact soil	9	3
Car/Pickup truck	Transport construction personnel	1	5
Delivery truck	Deliver materials	1	3
Maintenance truck	Maintain and refuel equipment	3	1
Below-Grade Construction			
Backhoe	Excavate and load materials	6	1
Loader	Move bulk material	6	2
Dump Truck (20 CY)	Transport impact/export material	3	2
Skid steer loader	Move rebar, equipment, masonry, and other materials	4	1
Water truck	Supress dust	3	1
Concrete truck	Deliver and pour concrete	0.5 (2 days per week for 4 months)	15
Ditch-witch	Excavate trenches	6	1
Car/Pickup truck	Transport construction personnel	0	15
Substation Equipment Installation			
Crew truck	Transport construction personnel	0	5
Boom truck	Place material and set steel	6	2
Manlift	Set steel and install equipment	6	1
Bucket truck	Set steel and install equipment	5	4
Car/Pickup truck	Transport construction personnel	0	8

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Cable dolly (trailer)	Transport reels of conductor	No Engine	1
Stringing rig (trailer)	Assist with conductor installation	No Engine	2
Oil rig (trailer w/generator)	Process transformer oil	24 (10 days for manufacturer setup)	1
Water truck	Supress dust	2	1
12 kV Distribution Relocation			
Duct Bank Construction and Vault Installation			
Crane 60 Ton	Lift and place materials	6	1
Crane Support	Support crane use	1	1
Bobcat	Excavate, move, and load materials	6	4
Backhoe	Excavate and load materials	8	3
Trackhoe	Excavate and load materials	8	1
Dump/Haul Truck	Transport impact/export material	1	9
Construction Truck	Transport construction personnel	2	3
Pickup Truck	Transport construction personnel	1	5
Pickup w/saw cutter trailer	Cut pavement	1	2
Concrete trucks	Deliver and pour concrete	1	7
Surface Machine	Repair pavement	6	1
Asphalt dump truck	Deliver and place asphalt	1	5
Dump Truck w/compressor & emulsion sprayer	Repair pavement	7	2
Roller	Compact pavement	4	2

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Cable Installation and Cutover			
Line Truck	Pull cable into position	1	1
Puller	Pull cable into position	2	1
Reel Trailer	Feed new cable to the puller or collect old cable	1	1
Splice Truck	Store splicing supplies	1	1
Pickup Truck	Transport construction personnel	1	1
69 kV Loop-In			
Foundation Installation			
Drill rig	Excavate soil	8	1
Forklift	Place materials	4	1
Pickup truck	Transport construction personnel	0	2
Concrete truck	Deliver and pour concrete	4	5
Boom truck	Place rebar cage	3	1
Dump truck	Haul excavated materials	4	1
Backhoe	Excavate soil	4	1
Generator	Provide power to the work area	4	1
Pole Installation and Removal			
Boom truck	Erect poles	8	1
Bucket truck	Erect poles and install conductor	8	1
Flatbed truck	Deliver poles and hardware	6	1
Jack hammer	Break up existing foundation	8	1

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Compressor	Power air tools	8	1
Conductor Installation and Cutover			
Pulling rig	Pull conductor into position	7	1
Wire truck/split reel	Deliver conductor reels	7	1
Boom truck	Move materials and install conductor	7	1
Bucket truck	Move materials and install conductor	7	2
Telecommunication System Extension			
Duct Bank Construction and Vault Installation			
Backhoe or Rockwheel	Excavate trenches	3	1
Dump truck (20 CY)	Haul excavated materials	3	2
Skid steer loader	Excavate, move, and load materials	3	1
Concrete/asphalt truck	Deliver concrete and asphalt	3	4
Cable Installation			
Line Truck	Pull cable into position	1	1
Puller	Pull cable into position	2	1
Reel Trailer	Feed new cable to the puller or collect old cable	1	1
Splice Truck	Store splicing supplies	1	1
Pickup Truck	Transport construction personnel	1	1

Vehicle/Equipment Type	Use	Hours Operating at Site/Day (per vehicle)	Quantity Required
Energization			
Testing and Commissioning			
Relay/telecommunication van	Test relay and telecommunications devices	3	3

Notes: Telecommunication cable installation will use the same equipment as the distribution cable installation; vehicles with an operating time of zero will be driven to the site and parked

	Conductor Installation and Cutover	2	January 2017
Telecommunication System Extension	Duct Bank Construction and Vault Installation	1	April 2017
	Cable Installation	1	May 2017
Energization	Testing and Commissioning	5	February 2017
	Energization	0.5	July 2017

all access gates will be locked to prevent the entry of unauthorized individuals. In addition, signage will be posted on the substation's exterior and at the entryway to restrict entry to authorized SDG&E personnel.

Routine maintenance is expected to require approximately six trips per year by a two- to four-person crew. Routine operations will require one or two workers in a light utility truck to visit the substation on a daily or weekly basis. It is anticipated that one annual major maintenance inspection will occur, requiring an estimated 10 personnel. It is anticipated that this inspection will take approximately one week to complete. Nighttime maintenance activities are not expected to occur more than once a year.

Landscape maintenance will occur on an as-needed basis for purposes of enhancing the streetscape along the perimeter of the substation and for safety and/or access. Such activities will generally require the presence of one to two maintenance vehicles and one or more employees to clear and/or trim vegetation to ensure that an adequate working space is maintained around the substation facilities.

3.7.1 12 kV Distribution Relocation

Maintenance may include replacement of damaged cables or connectors. Maintenance crews may consist of four to six personnel and require a tool truck, cable truck, assist truck, and/or trouble shooter truck. Routine inspections will occur annually to identify connection problems or inspection for equipment degradation.

3.7.2 69 kV Loop-In

It is anticipated that the power line circuit that loops into the substation will be inspected once per year. Non-emergency major maintenance may include the replacement of damaged insulators or other equipment. Maintenance crews may consist of as many as four people and may require a tool truck, an assist vehicle, and a large bucket lift truck. Insulators may require washing up to three times a year to prevent flashovers, equipment damage, and outages.

Operations and maintenance activities for the 69 kV loop-in will include routine inspection, maintenance, and repair activities. Both routine preventive maintenance and emergency procedures will occur in order to ensure that integrity of the system is maintained over the long term. Inspections may occur through ground patrols visiting the facilities. At a minimum, such routine inspections will occur annually to identify potential corrosion, equipment misalignment, loose fittings, and/or other mechanical problems.

3.7.3 Telecommunication System Extension

Typically, on-going or routine maintenance activities for fiber optic telecommunications cable is not required. As a result, the only activities associated with the operation and maintinence of this Proposed Project component will stem from emergency repairs or future changes to the fiber optic network design.

3.8 ANTICIPATED PERMITS AND APPROVALS

The CPUC is the lead California agency for the Proposed Project. SDG&E must comply with the CPUC's GO No. 131-D Section III-B, which contains the permitting requirements for the construction of the Proposed Project. This Proponent's Environmental Assessment is being prepared as part of an application to obtain a Permit to Construct (PTC) for the Proposed Project.

In addition to the PTC, SDG&E is required to obtain a number of other permits from federal, state, and local agencies. Table 3-7: Permit, Approval, and Consultation Requirements lists the permits, approvals, and licenses that SDG&E anticipates obtaining from jurisdictional agencies.

3.9 PROJECT DESIGN FEATURES AND ORDINARY CONSTRUCTION/OPERATING RESTRICTIONS

The Proposed Project includes design features and ordinary construction and operating restrictions that avoid and minimize environmental impacts. The design features and ordinary construction and operating restrictions incorporated into the Proposed Project include measures that are routinely implemented by SDG&E on other projects that involve ground disturbance. Many of these features and restrictions have been developed over time to avoid and minimize environmental impacts, to comply with SDG&E's Subregional NCCP, and to comply with applicable environmental laws and regulations. Consistent with its existing practices, SDG&E will implement these operating restrictions as appropriate during construction, operation, and maintenance to avoid and minimize potential environmental impacts.

A description of many of the design features and ordinary construction and operating restrictions incorporated into all phases of the Proposed Project follows.

- **Safety and Environmental Awareness Program.** SDG&E will prepare a Safety and Environmental Awareness Program (SEAP) for project-personnel. The SEAP may include training for relevant topics such as:

    - General safety procedures,
    - General environmental procedures,
    - Fire safety,
    - Biological resources,
    - Cultural resources,
    - Paleontological resources,
    - Hazardous materials protocols and BMPs, and
    - Storm Water Pollution Prevention Plan (SWPPP).

    The program will include a multi-level approach that is commensurate to each worker's role on the Proposed Project. Supervisors, including construction foremen, will be required to actively participate in a training session to identify the specific requirements of the Proposed Project. SDG&E crews and other staff will also be given training and a review of the Proposed Project requirements prior to the commencement of any grading or construction work.

Table 3-7: Permit, Approval, and Consultation Requirements

Permit, Approval, or Consultation	Agency	Jurisdiction/Purpose
Federal Agencies		
Implementation of SDG&E's NCCP	USFWS	Activities within NCCP coverage areas that impact biological resources (required only for review of the Proposed Project, and no approval or permit is involved)
State Agencies		
Permit to Construct	CPUC	Overall project approval and California Environmental Quality Act (CEQA) review
National Pollutant Discharge Elmination System General Construction Permit	State Water Resources Control Board (SWRCB)	Storm water discharges associated with construction activities disturbing more than one acre of land
Implementation of SDG&E's NCCP	CDFW	Activities within NCCP coverage areas (required only for review of Proposed Project, no approval or permit is involved)
Local Agencies		
Right-of-Entry Permit	North County Transit District (NCTD)	Access to NCTD property during construction
Right-of-Entry Permit	MTS	Access to MTS property during construction
License Agreement	MTS	Operation and maintenance within, under, or over a railroad ROW
Temporary Occupancy Agreement	BNSF Railway	Access to BNSF property during construction
Utility Agreeement License	BNSF Railway	Operation and maintenance within, under, or over a railroad ROW
Encroachment Permit	City of San Diego	Construction, operation, and maintenance within, under, or over city or county road ROW
Grading Permit	City of San Diego	On-site grading activities

- **Galvanized Steel Structures.** New structures will utilize galvanized steel to avoid potential adverse effects due to high moisture content in coastal areas. The dulled aspect of the galvanized steel poles will also minimize the potential for visual impacts relating to glare.

- **Aerial Marking.** SDG&E will consult with the FAA concerning aerial marking and lighting requirements for all new overhead facilities. As required, lighting and aerial marking will be added to applicable overhead facilities, including new structures.

- **Construction Scheduling.** To the greatest extent practical, SDG&E will plan construction of the Proposed Project such that any potential overlap with other SDG&E projects will be coordinated such that net impacts will be minimized.

- **Hazardous Materials.** SDG&E will address potential impacts relating to the handling and use of hazardous materials through compliance with numerous state and federal regulations, including, but not limited to:

    - Federal Occupational Safety and Health Administration (OSHA) regulations for worker safety in hazardous material remediation and hazardous waste operations (29 CFR Section 1910.120),

    - Federal OSHA regulations hazard communication for workers (29 CFR Section 1910.1200),

    - Federal OSHA regulations for toxic air contaminants for workers (29 CFR Section 1910.1000),

    - CalOSHA regulations for worker safety in hazardous material remediation and hazardous waste operations (8 California Code of Regulations [CCR] 5192),

    - CalOSHA regulations for hazard communication for workers (8 CCR 5194), and

    - Department of Toxic Substances Control (DTSC) regulations implementing Resource Conservation and Recovery Act of 1976 (RCRA) and the California Hazardous Waste Control Law (HWCL) (22 CCR Division 4.5).

- **SDG&E Subregional NCCP.** The Proposed Project will avoid and minimize impacts to biological resources through implementation of the SDG&E Subregional NCCP. The SDG&E Subregional NCCP establishes a mechanism for addressing biological resource impacts incidental to the development, maintenance, and repair of SDG&E facilities within the SDG&E Subregional NCCP coverage area.

- **SDG&E Water Quality Construction BMP Manual.** SDG&E's Water Quality Construction BMPs Manual (BMP Manual) organizes and presents SDG&E's standard water quality protection procedures for various specific actions that routinely occur as part of SDG&E's ongoing construction, operation, and maintenance activities. The primary focus of most BMPs is the reduction and/or elimination of potential water quality

impacts during construction. The BMPs described within the BMP Manual were derived from several sources including the State of California guidelines as well as the California Departement of Transportation (Caltrans) Water Quality BMPs. The BMP Manual will be utilized during construction (by way of preparation and implementation of the SWPPP), operation, and maintenance of the Proposed Project to ensure compliance with all relevant SDG&E and government-mandated regulatory water quality standards.

- **Erosion and Sediment Control and Pollution Prevention During Construction**. Projects that disturb one acre or more of soil are required to obtain coverage under the California SWRCB's General Permit for Storm Water Discharges Associated with Construction Activity Order No. 2009-0009-DWQ (Construction General Permit). To obtain coverage under the Construction General Permit, Permit Registration Documents—including a Notice of Intent, SWPPP, risk assessment, site map, certification, and annual fee—must be submitted electronically to the SWRCB, and a Waste Discharger Identification number must be assigned prior to initiating construction activities. The SWPPP will include the following:

    - Identification of pollutant sources and non-storm water discharges associated with construction activity

    - Specifications for BMPs that will be implemented, inspected, and maintained during Proposed Project construction to minimize erosion, the potential for accidental releases, and pollutants in the runoff from the construction areas (including pollutants from storage and maintenance areas, as well as laydown areas for building materials)

    - Specifications for spill response and implementation

    - A record of training provided to persons responsible for implementing the SWPPP

    - Reporting and record-keeping requirements

- During construction, the San Diego RWQCB would oversee and inspect for compliance with the Construction General Permit for the SWRCB, which is described further in Section 4.7 Hydrology and Water Quality. In addition, a Hazardous Waste and Spill Prevention Plan will be prepared prior to construction of the Proposed Project, and will be implemented during construction to ensure that any potential release or spill of hazardous materials is properly handled to reduce potential impacts to the less-than-significant level. All non-hazardous soil and grub material that will be transported off site may be disposed of at the Miramar Landfill, located approximately 7.2 miles northeast of the proposed Vine Substation.[6] All other construction waste (i.e., refuse,

[6] The Miramar Landfill is located at 5180 Convoy Street in the City of San Diego. The one-way truck trip distance required to access this facility is approximately 12.4 miles.

spoils, trash, oil, fuels, poles, pole structures, etc.) will be disposed of properly and in accordance with all applicable federal, state, and local laws regarding solid and hazardous waste disposal.

- **Temporary Lighting.** Temporary lighting at staging and storage areas will be directed on site and away from any sensitive receptors.

- **Visual Screening of Staging Yard.** Where the proposed Vine Substation site is visible to the public, opaque mesh or slats (or equivalent material) will be installed along a temporary construction fence that will soften the view of the site from roads, residences, and other public vantage points.

- **Materials.** Non-specular conductor and galvanized steel poles will be used in order to reduce potential glare.

- **Restoring Appearance of Temporarily Disturbed Areas.** When Proposed Project construction has been completed, all temporarily disturbed terrain will be restored, as needed and as appropriate, to approximate pre-construction conditions.

- **Soil Stabilization.** Disturbed areas must be stabilized per the SWPPP.

- **Fugitive Dust Control.** All unpaved construction areas will be watered up to two times daily during construction to reduce dust emissions and to meet SDAPCD Rule 55 requirements. SDG&E or its contractor will keep the construction area sufficiently dampened to control dust caused by construction and hauling, and will provide at all times reasonable dust control of areas subject to windblown erosion.

- **Bulk Material Transport.** All loads will be secured by covering or be sufficiently watered and use of at least two feet of freeboard to avoid carry-over.

- **Equipment Emissions.** SDG&E or its contractor will maintain and operate construction equipment to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues will have their engines turned off after five minutes when not in use. Construction activities will be phased and scheduled to avoid emission peaks, and equipment use will be curtailed during second-stage smog alerts.

- **Volatile Organic Compound (VOC) Reduction.** Low- and non-VOC-containing coatings, sealants, adhesives, solvents, asphalt, and architectural coatings will be used to reduce VOC emissions.

- **Mufflers.** Functioning mufflers will be maintained on all equipment.

- **Resident Notification.** Residents within 300 feet of the Proposed Project will receive notification of the start of construction at least one week prior to the start of construction activities within that area.

- **Construction Noise.** For the few locations where the Proposed Project could exceed the noise ordinances, as discussed previously, SDG&E would meet and confer with the City of San Diego to discuss temporarily deviating from the requirements of the Noise Ordinance (see Section 4.12.3 Impacts).

- **Standard Traffic Control Procedures.** SDG&E will implement traffic control plans to address potential disruption of traffic circulation during construction activities and address any safety issues. These traffic control plans will be prepared by the project engineer or contractor and subject to approval by the appropriate jurisdictional agency, such as the City of San Diego.

- **Encroachment Permits.** SDG&E will obtain the required encroachment permits from the City of San Diego for work within city streets and will ensure that proper safety measures are in place while construction work is occurring within and near public roadways. These safety measures include the use of flagging, proper signage, and orange cones to alert the public to construction activities near and within the roadway.

3.10 APPLICANT-PROPOSED MEASURES

In addition to the above project design features and ordinary construction/operating restrictions included as part of the Proposed Project, SDG&E will also incorporate the APMs that have been identified and developed specifically for the Proposed Project during the preparation of the PEA. Table 3-8: Applicant-Proposed Measures identifies the APMs and indicates which Proposed Project component they apply to. The applicable resource sections within Chapter 4 – Environmental Impact Assessment outline how and when the APMs will be applied to avoid or minimize impacts to a less-than-significant level.

Until final design is complete, and in some cases until installation occurs, utility projects must remain more flexible in the definition of their ultimate configuration and placement than most non-utility projects. The Proposed Project may encounter unique man-made and natural features or site-specific engineering challenges that could not be reasonably foreseen and specifically planned for in advance. The APMs take into consideration the potential for the Proposed Project to encounter such features or challenges and enhance SDG&E's ability to avoid or minimize future potential impacts to sensitive environmental resources.

The APMs allow for limited project design flexibility while avoiding or minimizing environmental impacts, to the extent feasible. As defined in CEQA, "feasible" is defined as being "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors" while attaining the project's basic objectives and its purpose and need.

3.10.0 Implementation of Applicant-Proposed Measures

SDG&E will be responsible for overseeing the assembly of construction and environmental teams that will implement and evaluate the Proposed Project APMs. SDG&E maintains an environmental compliance management program to allow for implementation of the APMs to be monitored, documented, and enforced during each Proposed Project phase, as appropriate. All

those contracted by SDG&E to perform this work will be contractually bound to properly implement the APMs to ensure their effectiveness in reducing potential environmental effects.

Implementation of the proposed APMs will be the responsibility of the environmental compliance team. The team will include an environmental project manager, resource specialists, and environmental monitors. All APMs will be implemented consistent with applicable federal, state, and local regulations. The environmental compliance team will be responsible for the inspection, documentation, and reporting of SDG&E compliance with all APMs as proposed. As needed, environmental specialists will be retained to verify that all APMs are properly implemented during the construction phase.

If conditions occur where construction may potentially adversely affect a known or previously unknown environmentally sensitive resource, or if construction activities significantly deviate from Proposed Project requirements, SDG&E monitors and/or contract administrators will have the authority to halt construction activities, if needed, until an alternative method or approach can be identified. Any concerns that arise during implementation of the APMs will be communicated to the appropriate authority to determine if corrective action is required, or the concerns will be addressed on site, as applicable.

As the proposed APMs are implemented, environmental monitors from SDG&E will be responsible for the review and documentation of such activities. Field notes and digital photographs will be used to document and describe the status of APMs as necessary.

Table 3-8: Applicant-Proposed Measures

APM Number	Description	Justification	Proposed Project Component			
			Proposed Vine 69/12 kV Substation	12 kV Distribution Relocation	69 kV Loop-In	Telecommunication System Extension
CUL-01	An archaeological monitor will be present during ground-disturbing activities. In the event that cultural resources are discovered, the archaeological monitor will have the authority to divert or temporarily halt ground disturbance to allow evaluation of the potentially significant cultural resources. The archaeological monitor will contact SDG&E's Cultural Resource Specialist and Environmental Project Manager at the time of discovery. The archaeological monitor, in consultation with SDG&E's Cultural Resource Specialist, will determine the significance of the discovered resources. SDG&E's Cultural Resource Specialist and Environmental Project Manager must concur with the evaluation procedures to be performed before construction activities in the vicinity of the discovery are allowed to resume. For significant cultural resources, a Research Design and Data Recovery Program will be prepared and carried out to mitigate impacts. All collected cultural remains will be cleaned, cataloged, and permanently curated with an appropriate institution. All artifacts will be analyzed to identify function and chronology as they relate to the history of the area. Faunal material will be identified to the species level. A monitoring results report—which includes appropriate graphics and describes the results, analyses, and conclusions of the monitoring program—will be prepared and submitted to SDG&E's Cultural Resource Specialist and Environmental Project Manager following completion of the program. Any cultural sites or features encountered will be recorded on appropriate Department of Parks and Recreation forms. All forms and reports will be submitted to the SCIC at San Diego State University.	This measure will ensure that ground-disturbing activities are monitored so that impacts can be mitigated through proper investigation and recovery of cultural resources.	✓	✓	✓	✓
CUL-02	A paleontological monitor will be on site to observe excavation operations that involve the original cutting of deposits with high paleontological resource sensitivity (i.e., Bay Point Formation) to depths greater than 3.5 feet. In the event that fossils are encountered, the paleontological monitor will have the authority to divert or temporarily halt construction activities in the area of discovery to allow the recovery of fossil remains. The paleontological monitor will contact SDG&E's Cultural Resource Specialist and Environmental Project Manager at the time of discovery. The paleontologist, in consultation with SDG&E's Cultural Resource Specialist, will determine the significance of the discovered resources. SDG&E's Cultural Resource Specialist and Environmental Project Manager must concur with the evaluation procedures to be performed before construction activities are allowed to resume. When fossils are discovered, a paleontologist (or the paleontological monitor) will recover them, along with pertinent stratigraphic data. Fossil remains collected during monitoring and salvage will be cleaned, repaired, sorted, cataloged, and deposited in a scientific institution with permanent paleontological collections. A final	This measure will ensure that excavation in areas containing Pleistocene-age deposits of the Bay Point Formation and Lindavista Formation are monitored so that impacts can be mitigated through proper investigation and recovery of cultural resources.	✓	✓	✓	✓

APM Number	Description	Justification	Proposed Project Component			
			Proposed Vine 69/12 kV Substation	12 kV Distribution Relocation	69 kV Loop-In	Telecommunication System Extension
	summary report will be completed that outlines the results of the mitigation program. The report will discuss the methods used, stratigraphic section(s) exposed, fossils collected, and significance of recovered fossils.					
HAZ-01	Prior to approval of the final construction plans for the Proposed Project, a project-specific Hazardous Materials and Waste Management Plan will be prepared for the construction phase of the Proposed Project to ensure compliance with all applicable federal, state, and local regulations. The Hazardous Materials and Waste Management Plan will reduce or avoid the use of potentially hazardous materials for the purposes of worker safety, protection from groundwater contamination, and proper disposal of hazardous materials. The plan will include the following information related to hazardous materials and waste, as applicable: • A list of the hazardous materials that will be present on site during construction, including information regarding their storage, use, and transportation; • Any secondary containment and countermeasures that will be required for onsite hazardous materials, as well as the required responses for different quantities of potential spills; • A list of spill response materials and the locations of such materials at the Proposed Project site during construction; • A list of the adequate safety and fire suppression devices for construction activities involving toxic, flammable, or exposure materials; • A description of the waste-specific management and disposal procedures that will be conducted for any hazardous materials that will be used or are discovered during construction of the Proposed Project; and • A description of the waste minimization procedures to be implemented during construction of the Proposed Project.	The Hazardous Materials and Waste Management Plan will reduce or avoid the use of potentially hazardous materials for the purposes of worker safety, protection from groundwater contamination, and proper disposal of hazardous materials.	✓

TABLE OF CONTENTS

4.0 INTRODUCTION..... 4-1

CHAPTER 4 – ENVIRONMENTAL IMPACT ASSESSMENT SUMMARY

4.0 INTRODUCTION

The following sections (4.1 through 4.17) evaluate the potential environmental impacts from construction and operation of the San Diego Gas & Electric Company Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project). In accordance with the California Environmental Quality Act, the environmental impacts associated with the Proposed Project components are evaluated for the following resource areas:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation and Traffic
- Utilities and Service Systems

Sections 4.1 through 4.17 include discussions of the existing conditions as they pertain to each resource area, as well as the Proposed Project's potential impacts to these resources. In addition, at the beginning of each section, a checklist summarizing the level of impact (i.e., No Impact, Less-than-Significant Impact, Less-than-Significant Impact with Mitigation Incorporated, and Potentially Significant Impact) to these resource areas, according to the significance criteria used for analysis, has been included. Section 4.18 Cumulative Analysis discusses past, present, and reasonably foreseeable future projects within the Proposed Project area and the Proposed Project's potential to contribute to a significant cumulative effect.

The Proposed Project will result in no impacts to the following resource areas:

- Agriculture and Forestry Resources
- Land Use and Planning
- Minerals
- Population and Housing
- Public Services

- Recreation

The Proposed Project will result in less-than-significant impacts to the following resource areas:

- Aethetics
- Air Quality
- Biological Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hydrology and Water Quality
- Noise
- Transportation and Traffic
- Utilities and Service Systems
- Cumulative Impacts

The Proposed Project will result in potentially significant impacts to the remaining two resource areas; however, with the implementation of applicant-proposed measures (APMs), these impacts will be reduced to a less-than-significant level. A brief summary of these resource areas and the primary impacts that will result from the Proposed Project are provided as follows:

- Cultural Resources – Potential for discovery and damage to unknown cultural resources resulting from grading and excavation activities

- Hazards and Hazardous Materials – Temporary and permanent impacts associated with the transport and use of hazardous materials, as well as the potential release of hazardous materials resulting from the operation of the proposed Vine Substation

APMs will be implemented to ensure that all potential impacts are reduced to a less-than-significant level and are discussed in their relevant sections. In addition, these APMs are summarized in Table 3-8: Applicant-Proposed Measures in Chapter 3 – Project Description.

4.1 AESTHETICS

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?				✓
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?				✓
c) Substantially degrade the existing visual character or quality of the site and its surroundings?			✓	
d) Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?			✓	

4.1.0 Introduction

Visual or aesthetic resources are generally defined as both the natural and built features of the landscape that can be seen and that contribute to the public's experience and appreciation of the environment. Visual resource or aesthetic impacts are generally defined in terms of a project's physical characteristics, potential visibility, and the extent to which its presence would alter the perceived visual character and quality of the environment. The Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) involves installing a new substation in a landscape dominated by industrial, transportation, and commercial structures. The Proposed Project will represent a noticeable change that is consistent with the existing visual environment and will not substantially alter the existing character of the Proposed Project area. As a result, the visual impacts of the Proposed Project will be less than significant.

4.1.1 Methodology

The analysis of potential visual effects associated with the Proposed Project is based on the review of technical data, including maps, drawings, and photographs of the Proposed Project, as well as field observations that were conducted in December 2013, to document existing visual conditions and to identify potentially affected sensitive viewing locations in the Proposed Project vicinity. Computer-generated visual simulations that show the Proposed Project's appearance were also used to demonstrate its anticipated appearance after construction is complete.

Based on review of Proposed Project data, background information, and field observations, the following viewing locations were determined to be potentially sensitive:

- locations along designated scenic roadways where Proposed Project-related change would be seen;
- locations along nearby travel corridors, including the railroad; and
- nearby residential areas.

The analysis that follows addresses the California Environmental Quality Act (CEQA) Guidelines for visual impact analysis. Central to this assessment is an evaluation of representative public views from which the Proposed Project will be visible. To document the visual changes that would occur, visual simulations depict the proposed Vine Substation site within the existing urban context from two close-range public viewpoints. The visual simulations are presented as before-and-after images. The visual impact assessment was based on an evaluation of the changes to the existing visual resources that would result from construction and operation of the Proposed Project.

4.1.2 Existing Conditions

This section includes a description of the visual setting and regulatory framework. Existing visual conditions are characterized in terms of the physical landscape features that comprise visual resources in the Proposed Project area.

Regulatory Background

Because the California Public Utilities Commission has exclusive jurisdiction over the siting, design, and construction of the Proposed Project, the Proposed Project is not subject to local discretionary land-use regulations. The following analysis of local regulations relating to visual resources is provided for informational purposes. As outlined in the following sections, the construction and operation of the Proposed Project will not conflict with any environmental plans, policies, or regulations adopted by agencies with jurisdiction over local aesthetic regulations.

City of San Diego General Plan

The City of San Diego (City) General Plan contains several elements, including Land Use and Community Planning, Urban Design, Recreation, Conservation, and Historic Preservation that address the need to protect the City's visual resources to some degree. The Mobility, Urban Design, Public Facilities, Services and Safety, and Recreation Elements of the San Diego General Plan (2008) contain provisions regarding aesthetics in the Proposed Project area.

Land Use Element

The Land Use Element delineates 50 Community Plan areas within the city, each with its own adopted community plan. The Proposed Project site is located within the Midway/Pacific Highway Corridor Community Plan area. This element also discusses the relationship between the Coastal Zone and Community Plans. However, it does not contain policies regarding aesthetics that apply to the Proposed Project.

Mobility Element

The 1989 Transportation Element (City of San Diego, 1989, p. 69) identified City-designated scenic routes, including North Harbor Drive, which is a portion of San Diego's 52-mile scenic drive; however, due to the intervening buildings and highway structures, the Proposed Project is not visible from this road.

The Mobility Element of the 2008 General Plan (City of San Diego 2008) supersedes the 1989 Transportation Element. While it recommends designating scenic routes within the City, no scenic routes are identified. Additionally, it recommends placing utility lines underground to the extent practicable (p. ME-25).

Urban Design Element

The Urban Design Element recommends minimizing the visual impact of utilities and undergrounding overhead utilities, and includes the following policies relevant to protecting or enhancing the visual environment:

a. Convert overhead utility wires and poles, and overhead structures such as those associated with supplying electric, communication, community antenna television, or similar service to underground.

b. Design and locate public and private utility infrastructure, such as phone, cable and communications boxes, transformers, meters, fuel ports, back-flow preventors, ventilation grilles, grease interceptors, irrigation valves, and any similar elements, to be integrated into adjacent development and as inconspicuous as possible. To minimize obstructions, elements in the sidewalk and public right-of-way should be located in below grade vaults or building recesses that do not encroach on the right of way (to the maximum extent permitted by codes). If located in a landscaped setback, they should be as far from the sidewalk as possible, clustered and integrated into the landscape design, and screened from public view with plant and/or fencelike elements.

Public Facilities, Services and Safety Element

The Public Facilities, Services and Safety Element recommends undergrounding utility lines. It also recommends incorporating public art into utility facilities.

In 2002, San Diego adopted a policy for the undergrounding of overhead utility lines to protect public health, safety, and general welfare.

- PF-M.4 Cooperatively plan for and design new or expanded public utilities and associated facilities (e.g., telecommunications infrastructure, planned energy generation facilities, gas compressor stations, gas transmission lines, electrical substations and other large scale gas and electrical facilities) to maximize environmental and community benefits.

  e. Incorporate public art with public utility facilities, especially in urban areas.

Recreation Element

The Recreation Element has general provisions regarding aesthetics in the Proposed Project area including preserving open space view corridors to the water and significant topographic features; however, the Proposed Project will not affect view corridors to the water nor will it substantially affect significant topographic features.

Midway-Pacific Highway Corridor Community Plan and Local Coastal Program Land Use Plan

The Proposed Project is located in the Midway/Pacific Highway Corridor Community Plan area, which encompasses approximately 800 acres of relatively flat land situated north of the Centre City area between Old Town and Point Loma. The area is composed of two basic elements—the central Midway area and the narrow, linear-shaped Pacific Highway Corridor, which contains some of the City's oldest industrial areas, including the Proposed Project site.

The community's plan also includes a Local Coastal Program (LCP) Land Use Program as a small portion of it is located in the Coastal Zone. The majority of the Proposed Project site is just outside of but adjacent to the LCP area, with the exception of the approximately 0.3-mile portion of the 12 kV distribution relocation that will be placed in an existing conduit within Pacific Highway.

The plan contains general provisions regarding urban design in commercial areas, including the following:

- Improve the aesthetic and functional qualities of commercial areas.
- Unify the streetscape throughout the community with the installation of landscaping in commercial areas and along the public right-of-way (ROW).
- Provide and maintain setback and view corridors from the public ROW.

In addition, the plan recommends that commercial areas located along the Pacific Highway Corridor not obstruct scenic vistas and maintain view corridors from all public ROWs. More detailed urban design guidelines are outlined for the portion of the community south of Sassafras Street. These include incorporating pedestrian-oriented features and landscaping. However, the Proposed Project site lies just outside this area.

California Department of Transportation: Scenic Highway Program

California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to highways. The State Scenic Highway System includes highways that are either eligible for designation as scenic highways or have been designated as such. The status of a state scenic highway changes from eligible to officially designated when the local jurisdiction adopts a scenic corridor protection program, applies to the California Department of Transportation for scenic highway approval, and receives the designation. A city or county may propose adding routes with outstanding scenic elements to the list of eligible highways; however, state legislation is required for them to become designated.

In San Diego County, the Cabrillo Freeway, located approximately 1.25 miles east of the site, is the nearest Designated State Scenic Highway. Because of intervening topography and distance, the Proposed Project site is not visible from this road. Interstate (I-) 5, passing within 125 feet of the Proposed Project is an Eligible State Scenic Highway.

Regional and Local Landscape Setting

Located in southwestern San Diego approximately 0.75 mile north of San Diego Bay, the Proposed Project area is situated on a broad, relatively flat marine terrace that includes the City of San Diego and surrounding communities. Undulating topography and the foothills of the Laguna Mountains are visible east of the Proposed Project site.

The approximately 1.5-acre proposed Vine Substation site is situated on a relatively narrow, rectangular-shaped parcel that is located approximately 1.5 miles north of San Diego's downtown core alongside I-5. The Proposed Project site is located in an area dominated by parking lots, rental car facilities, and low-rise industrial facilities, and is within view of San Diego International Airport, which is located approximately 0.75 mile southwest of the site. The Amtrak Pacific Surfliner, North County Transit District (NCTD) Coaster, and the San Diego Metropolitan Transit System (MTS) Trolley railroad corridor borders the Proposed Project site along its western perimeter. An elevated transition ramp connecting I-5 and Pacific Highway is located northwest of the proposed Vine Substation site, adjacent to the rail corridor.

The residential neighborhood of Midtown is located immediately east of I-5, situated approximately 250 feet above sea level. Open views toward downtown San Diego, San Diego Bay, and the Point Loma peninsula beyond the bay are available from some places within this residential area. Figure 4.1-1: Regional Landscape Context depicts the Proposed Project location within a regional and local landscape context.

The area surrounding the Proposed Project site is sparsely vegetated, with intermittent small street trees and palms and large shrubs visible along the nearby railroad corridor and I-5 embankment. Plants in the area consist largely of ornamental species with little evidence of native vegetation. Electrical utility poles as well as pole-mounted light fixtures along the highway, local streets, and within parking lots are noticeable features of the existing landscape in the vicinity of the Proposed Project site. The proposed Vine Substation site includes existing pole-mounted fixtures used for nighttime lighting.

Proposed Project Visibility and Viewshed

The Proposed Project viewshed is defined as the general area from which it is visible or can be seen. For purposes of describing a project's visual setting and assessing potential visual impacts, the viewshed can be broken down into distance zones of foreground, middleground, and background. The foreground is defined as the zone within 0.25 to 0.5 mile from the viewer. Landscape detail is most noticeable and objects generally appear most prominent when seen in the foreground. The middleground is a zone that extends from the foreground up to approximately three to five miles from the viewer, and the background extends from about three to five miles to infinity.

For the purpose of this analysis, the potential effects on foreground viewshed conditions are emphasized. The site topography and geography generally limit the Proposed Project's visibility to locations along nearby roads. Passengers on Amtrak Pacific Surfliner and NCTD Coaster trains, and the San Diego MTS Trolley, which run along the adjacent railroad corridor, have fleeting views of the Proposed Project site. From many locations within the surrounding area, views of the Proposed Project are partially or fully screened by intervening topography and structures. These existing visual conditions are more fully described in the sections that follow.

Potentially Affected Public Views

Viewer sensitivity, typically divided into high, moderate, and low categories, is one of the criterion employed for evaluating visual impacts and their degree of significance. The factors considered in assigning a sensitivity level include viewer activity, view duration, viewing distance, and adjacent land uses.

Potentially affected viewer groups within the Proposed Project area include motorists, rail passengers, pedestrians, and residents, as well as adjacent commercial workplaces, including a commercial printing business and a rental car facility. These viewers experience the Proposed Project site within the context of an established commercial and industrial setting.

Motorists constitute the most substantial viewer group, particularly those traveling on southbound I-5, who experience fleeting, elevated views of the site where there are gaps in the roadside vegetation. Motorists on Pacific Highway and those traveling on surface streets, including Kettner Boulevard, Vine Street, and California Street have longer duration views of the Proposed Project site, due in part to slower vehicle speeds and to more open views of the site.

Rail passengers, including local travelers on the Green Line Trolley line from northern San Diego and regional travelers on Amtrak's Pacific Surfliner and NCTD's Coaster, are the second most numerous viewer group. The Proposed Project site is situated adjacent to a stretch of rail corridor between Washington Street Station and Middletown Station, which are approximately 0.3 mile from the proposed Vine Substation site. The Proposed Project site is not visible from these two stations; however, it can be seen from passing trains or trolleys, although the views are brief in duration, typically lasting well under a minute.

Pedestrians on sidewalks along Vine Street and Kettner Boulevard adjacent to the site comprise the third most prominent viewer group. However, given the automobile-oriented aspect of many nearby businesses, pedestrians are relatively few in numbers. Pedestrian views are relatively brief in duration, potentially lasting up to several minutes, before intervening topography interrupts the site view.

The fourth viewer group consists of residents of the Midtown neighborhood located east of I-5. The nearest residences lie approximately 450 feet east of the Proposed Project site. However, as described in the following subsection, the closely spaced buildings and mature vegetation lining the streets, together with the elevated embankment of the I-5 corridor, largely block views toward the site. While the Proposed Project site is potentially visible from the upper stories of a limited number of residences, these views would be seen within the context of an eight-lane freeway, surrounding industrial facilities, and the nearby airport.

Figure 4.1-1:
Regional Landscape Context
SDG&E Vine 69/12 kV Substation Project

Visual Character of the Proposed Project Site

This section provides a description of the visual character found within the Proposed Project area and includes photographs that document representative views of the Proposed Project. The locations of photograph viewpoints are delineated on Figure 4.1-2: Photograph Viewpoint Locations. Figure 4.1-3: Photographs of the Proposed Project Site and Surrounding Area provides a set of eight photographs to document the existing views of the Proposed Project site.

Photograph 1 is a close-range view of the proposed Vine Substation site looking southeast from California Street that includes visual elements typical of the area immediately surrounding the site. Low-rise commercial and industrial buildings and small trees associated with individual businesses largely screen views of the site upon approaching from the north along this road. Additional open views are available from Vine Street along the northern perimeter of the site. From these areas, the existing parking lot, fence, and remnants of a masonry wall along Vine Street are seen against the vegetated I-5 embankment and retaining wall situated above Kettner Boulevard. An existing wood pole and concrete guy pole are prominent vertical elements visible along Vine Street.

Photograph 2 is an open street-level view looking south toward the proposed Vine Substation site from Kettner Boulevard near Vine Street. Unlike the view shown in Photograph 1 where many of the landscape elements blend in with the elevated backdrop, the same or similar elements—commercial signage, palm trees along Kettner Blvd, and numerous utility poles—appear prominently against the sky in Photograph 2 where the terrain descends gradually toward San Diego Bay, which is partially visible below the distant horizon.

Photograph 3 provides a view from southbound I-5 looking south. Typically, views toward the Proposed Project site from I-5 are screened by large roadside shrubs. However, the underpass at Vine Street provides a break in the roadway vegetation and a brief view of the site is available from southbound traffic lanes, as shown in Photograph 3. In this elevated view, the full extent of the Proposed Project area, as well as adjacent parking lots, existing utility poles, distant office buildings, the Pacific Highway transition ramp, the airport runway, and a larger portion of San Diego Bay are apparent. Palm trees planted intermittently along Kettner Boulevard provide some visual interest but little screening.

Photograph 4 shows a view downhill from the intersection of Vine Street and State Street toward the Vine Street underpass at I-5, which is less than 0.25 mile away. From nearby Midtown, views toward the Proposed Project site are almost completely blocked by the I-5 embankment and the closely spaced buildings and mature vegetation that line the streets of this residential neighborhood. Only a small portion of the Proposed Project site's northern perimeter can be seen through the opening provided by the underpass, and is less noticeable in comparison to the more dominant view of the airport and an adjacent construction site. Views of the northwestern boundary of San Diego Bay and the hills of Point Loma peninsula also provide focal points.

Photograph 5 is a view from Kettner Boulevard looking northwest toward the southern portion of the proposed Vine Substation site. From this vantage point, intervening structures that include low buildings associated with car rental facilities, signs and fencing, and street traffic partially screen views of the Proposed Project site.

Photograph 6 offers an elevated view of the Proposed Project site looking northwest from the transition ramp that connects I-5 to Pacific Highway. From this perspective, the visibility of the Proposed Project site is considerably diminished when viewed against the hillside backdrop, particularly when seen within the context of commercial and industrial elements that dominate the landscape.

From below the highway ramp, Photograph 7 provides a view looking northwest along the railroad corridor near Sassafras Street toward the western perimeter of the Proposed Project site. Existing vegetation lining the east side of the tracks largely screens views toward the proposed Vine Substation site when seen from this perspective.

Photograph 8, which was taken from the pedestrian overpass crossing the Pacific Highway, is an elevated close-range overview of the Proposed Project site looking northeast. The railroad tracks, trolley catenary structures, and existing overhead utility lines dominate the foreground while the I-5 embankment and some hillside residences form the backdrop.

Physical Characteristics of the Proposed Project

The Proposed Project involves the construction of the proposed Vine Substation on an approximately 1.5-acre parcel of land that is currently lease for long-term airport parking. As part of the Proposed Project design, the Vine Substation will be enclosed by a 10-foot-tall "Lapaz" brown-colored masonry perimeter wall. Facility components include transformer banks and firewalls, in addition to a control shelter. These components range in height from approximately eight to 16 feet. In addition, two 30-foot-high rack structures located near the western perimeter of the substation site will be installed. With the exception of the rack structures, the substation components will not be visible from the perspective of most viewers at street level in the immediate vicinity of the site. Figure 3-7: Vine Substation Profile View in Chapter 3 – Project Description provides a section and elevation drawing that illustrates substation profile views with the perimeter screening wall.

In addition to the previously described Vine Substation components, the Proposed Project involves the relocation of existing and installation of new distribution facilities. The bulk of the changes associated with these distribution facilities will occur underground; therefore, they will not be visible following construction. The 12 kV distribution relocation will involve the installation of approximately nine new above-ground switches which will be housed in painted enclosures. The enclosures will be mounted on concrete pads within the existing sidewalks and will be consistent with other aboveground facilities in the area. The project will also involve modifications to the existing power line facilities. These modifications include removing two approximately 70-foot-tall existing wood poles and one approximately 28-foot-tall steel guy pole. Three new approximately 100-foot-tall self-supported tubular steel poles will be installed on the west side of the proposed Vine Substation. The Proposed Project will also involve extending an existing telecommunication system; however, this work will be located primarily below ground or in association with the modified power line facilities.

Figure 4.1-3:
Photographs of Proposed Project Site and Surrounding Area
SDG&E Vine 69/12 kV Substation Project

Conceptual Landscape Plan

Landscaping will be installed at the proposed Vine Substation as part of the Proposed Project design. Figure 4.1-4: Conceptual Landscape Plan presents the proposed landscaping to be installed at the new Vine Substation following construction activities. The conceptual landscape plan calls for informal clusters of small and medium height shrubs outside the perimeter wall along Vine Street and Kettner Boulevard. Given the lack of existing landscaping at the site, the new landscaping will enhance the streetscape in the Proposed Project area. In addition, the proposed clusters of small and medium shrubs will provide some screening of lower portions of the perimeter wall. Suggested plant species are drought-tolerant and consistent with SDG&E requirements for planting near substation facilities.

Lighting

Substation lighting will be provided by approximately eight flood lights mounted on interior substation walls, one at each of the entry gates, and four lights mounted on the control shelter. Lighting may also be installed on the steel rack. All on-site lighting will be oriented downward to minimize glare onto surrounding property. With the exception of the gate entry lights, which will remain on at all times, the substation lighting will not be turned on unless it is required for nighttime work and/or emergencies. Nighttime maintenance is not expected to occur more than once per year.

In addition, due to the proximity of the proposed Vine Substation site to San Diego International Airport, flashing red beacons or white strobe lights on two to three poles located along the railroad tracks outside of the proposed Vine Substation site will be installed if necessary to comply with Federal Aviation Administration (FAA) requirements.

4.1.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the CEQA Guidelines. Impacts to aesthetic resources would be considered significant if the Proposed Project:

- Has a substantial adverse effect on a scenic vista
- Substantially damages scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway
- Substantially degrades the existing visual character or quality of the site and its surroundings
- Creates a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

In applying these criteria to determine significance, the extent of the Proposed Project's visibility from sensitive viewing locations, the degree to which the Proposed Project components will contrast with or be integrated into the existing landscape, the extent of change in the landscape's composition and character, and the number and sensitivity of viewers are taken into account. Proposed Project conformance with public policies regarding visual quality is also considered.

Computer-generated visual simulations were used to evaluate the visual impacts of the Proposed Project, a description of which are included in the discussions that follow.

Question 4.1a – Scenic Vista Effects – *No Impact*

CEQA requires that the Proposed Project be evaluated as to whether its implementation has a substantial, adverse effect on a scenic vista. For the purposes of this evaluation, a scenic vista is defined as a distant public view along or through an opening or corridor that is recognized and valued for its scenic quality. Using this definition, there are no scenic vistas in the Proposed Project viewshed; therefore, the Proposed Project will not have a substantial effect on a scenic vista, and there will be no impact.

Question 4.1b – Scenic Resource Damage within a State Scenic Highway – *No Impact*

In San Diego County, the Cabrillo Freeway, which is located approximately 1.25 miles from the Proposed Project site, is the nearest designated State Scenic Highway. Because of intervening topography and distance from the site, the Proposed Project will not be visible from this roadway.

I-5, an eligible State Scenic Highway, passes within 125 feet of the Proposed Project site. Brief views of the Proposed Project will primarily be available from the southbound direction along this roadway; however, some views may also be available when traveling in the northbound direction. The speed limit on I-5 is 65 miles per hour; thus, motorists will only be provided a momentary glimpse of the Proposed Project while passing by. In addition, as noted below in the response to Question 4.1c, these views will be seen within the context of a developed, industrial landscape and will not obstruct views of San Diego Bay and the downtown San Diego skyline. Therefore, the Proposed Project will not substantially damage scenic resources within a State Scenic Highway, and there will be no impact.

Question 4.1c – Visual Character Degradation

Construction – Less-than-Significant Impact

Construction-related visual impacts will result from the presence of equipment, materials, and work crews along the underground distribution line route and at the Kettner Substation and proposed Vine Substation site. Views of the Proposed Project will generally occur from vantage points along Kettner Boulevard, Vine Street, California Street, Pacific Highway, and I-5, and to a lesser extent, from West Hawthorn and West Laurel streets. Construction activities will be noticeable to varying degrees and will be seen by motorists, rail passengers, and pedestrians. However, construction activities will be temporary in nature, taking place over an approximately 19-month period, and will occur within an industrial setting where trucks, trains, and other large machinery are found. Therefore, impacts to visual resources as the result of construction will be considered to be less than significant.

LANDSCAPE CONCEPT

The Vine Substation landscape plan calls for informal clusters of small and medium height shrubs to be planted within the setback area between the perimeter wall and the sidewalk along Kettner Boulevard and Vine Street. Landscaping will enhance the appearance of the substation site and also screen lower portions of the wall. The suggested plant palette consists of drought tolerant species that are approved by SDG&E for planting near substation facilities.

.

NOTES:

1. Landscape layout is preliminary and subject to change based on final engineering and other factors.
2. A drip irrigation system will be installed to provide regular watering of new landscaping.
3. Bark mulch to a depth of 3 inches will be applied within the planting strip for water conservation and weed suppression.
4. All planting shall meet clearance requirements for underground and overhead conductors and be consistent with SDG&E and CPUC safety, operations, and maintenance requirements for landscaping in proximity to transmission facilities.

PRELIMINARY CONCEPT
Subject to change based on additional information and final engineering design.

PLANT PALETTE LEGEND

SYMBOL	TYPE OF PLANT	APPROXIMATE QUANTITY	SUGGESTED SPECIES	CONTAINER SIZE	APPROXIMATE MATURE HEIGHT/SPREAD
	Medium height broad leaf evergreen shrub	21	Leptospermum scoparium "Gaiety Girl" or "Ruby Glow" (Red New Zealand Tea Tree)	5 Gallon	5' / 4'
	Small broad leaf evergreen shrub	16	Rhaphiolepis indica (Indian Hawthorn)	5 Gallon	3'-5' / 5'

Figure 4.1-4:
Conceptual Landscape Plan
SDG&E Vine 69/12 kV Substation Project

Operation and Maintenance – Less-than-Significant Impact

As shown in Figure 4.1-5: Existing View and Visual Simulation – California Street and Figure 4.1-6: Existing View and Visual Simulation – Southbound I-5, to varying degrees, portions of the Proposed Project will be visible to the public from some locations within the Proposed Project vicinity. The Proposed Project includes the relocation of 12 kV distribution lines; however, this component will be located underground and will generally not be visible during operation and maintenance of the Proposed Project. The three TSPs that will be installed west of the proposed Vine Substation to accommodate the 69 kV loop-in will replace four existing structures located south and west of the site, and will be seen as an incremental change to the existing view. The proposed Vine Substation will represent a noticeable change to the existing visual environment; however, the simulations demonstrate that the presence of the proposed Vine Substation will not substantially alter existing landscape character and visual quality within the Proposed Project area.

Figure 4.1-5: Existing View and Visual Simulation – California Street portrays an existing view of the Proposed Project site along with a visual simulation of the proposed Vine Substation looking south from California Street near Vine Street. This close-range perspective approximates the view experienced by passengers traveling on the adjacent rail corridor as well as passing local motorists and pedestrians in the immediate vicinity of the Proposed Project site. An open-surface parking facility currently occupies the Proposed Project site in the center foreground and a remnant masonry wall and chain-link fencing topped by razor wire enclose the paved parking area. A stand of shrubs partially screens the facility from the railroad corridor, which lies outside the view to the right. A wooden pole supported by a white guy pole is prominent in the foreground, while several steel floodlight standards can be seen within the fenced area. Concrete retaining walls and the vegetated embankment of the I-5 corridor are clearly visible above the roadway a short distance beyond the parking facility. A section of highway guardrail, Cobra head light standards, roadway signs, and a billboard along the I-5 right-of-way can also be seen along with part of the elevated roadway structure connecting I-5 to Pacific Highway in the distance on the right. On the left, portions of several residences are also visible above I-5.

The Figure 4.1-5: Existing View and Visual Simulation – California Street simulation view shows the proposed Vine Substation replacing the existing parking lot. A ten-foot-high masonry perimeter wall encloses the facility, effectively screening substation equipment, with the exception of the taller components that are encompassed by steel racks that are visible above the wall. The Vine Street entrance gate with multiple lighter-colored warning signs can be seen in the left foreground. The existing wooden pole and guy pole visible in the existing view have been removed, while new overhead conductors connect the substation with two new TSPs located out of the view to the right. Augmenting the existing stand of vegetation along the western perimeter of the site, which partially screens the wall and substation equipment visible above the wall, new landscaping has been installed along Vine Street at the base of the wall. Figure 4.1-4: Conceptual Landscape Plan illustrates the anticipated landscaping that will be installed at the proposed Vine Substation.

The Figure 4.1-5: Existing View and Visual Simulation – California Street simulation view demonstrates a noticeable change to the visual character of the area as seen from this close range

perspective, and shows that the Proposed Project represents an incremental improvement to the visual environment. The introduction of landscaping along Vine Street also results in a minor improvement to the streetscape. In addition, the earth-toned masonry perimeter wall (in place of the chain link fence) that will be constructed as part of the Proposed Project reduces visual clutter within this predominantly industrial landscape.

Figure 4.1-6: Existing View and Visual Simulation – Southbound I-5 presents a before-and-after view toward the proposed substation site as seen by southbound motorists on I-5 from approximately 150 feet away at the Vine Street overpass. From this elevated vantage point, a break in roadside vegetation permits a brief view of the Proposed Project site along with a panoramic view of the downtown San Diego skyline, San Diego Bay, and portions of the airport. In the existing view, a nearly full parking lot occupies the Proposed Project site in the foreground. Parked cars on the site appear nearly contiguous with other nearby expanses of parked cars south and west of the site. Except for several palm trees along Kettner Boulevard and vines along a far perimeter fence, the area beyond I-5 is nearly completely devoid of vegetation. The view toward San Diego Bay and Coronado Island on the horizon is interrupted by infrastructure associated with the railway corridor and Pacific Highway overpass just west of the site, and in the distance, airport construction and maintenance activities as well as maritime activities along the bay frontage.

The Figure 4.1-6: Existing View and Visual Simulation – Southbound I-5 simulation view shows the proposed Vine Substation, seen in the foreground. This elevated perspective provides an overview of substation equipment and the perimeter wall in its entirety. Replacing the existing utility pole along Vine Street, two taller TSPs are visible west of the site along the railroad tracks. Like the poles they replace, these poles are a minor intrusion into the bay view. Along Kettner Boulevard, existing palm trees have been removed and replaced by low shrubs along the perimeter wall that extends along the Vine Street frontage. Given this elevated perspective, the height of facility equipment, in particular the racks that extend above the perimeter wall seen in the simulation, is not particularly noticeable from this I-5 motorist perspective. Moreover, when seen from this perspective, the rectangular form of the overall facility serves to minimize visual contrasts with nearby structures including adjacent warehouses, office buildings and the Pacific Highway ramp.

A comparison of the views provided in Figure 4.1-6: Existing View and Visual Simulation – Southbound I-5 indicates that the Proposed Project represents an incremental visual change to the urban landscape that will be briefly visible from this location, and given the industrial setting, will not be particularly noticeable. Although some components of the Proposed Project are taller than existing site features, these elements will not substantially affect views of San Diego Bay or the downtown San Diego skyline. Therefore, the Proposed Project will not substantially alter or degrade the character of views from I-5 or other public vantage points, and the impact will be less than significant.

Figure 4.1-6:
Existing View and Visual Simulation – Southbound I-5
SDG&E Vine 69/12 kV Substation Project

Question 4.1d – New Light or Glare

Construction – Less-than-Significant Impact

For the most part, construction of the Proposed Project will occur during daytime hours. For some construction activities, work may be required at night. If nighttime construction is necessary, any temporary lighting used during construction will be directed on site and away from potentially sensitive receptors, including residences. Given the primarily industrial setting, potential temporary lighting effects will be less than significant.

Operation and Maintenance – No Impact

As previously noted, floodlights will be installed at approximately eight locations within the substation facility. However, with the exception of the two entry gate lights which will remain on at all times, the floodlights will not be turned on unless required for nighttime work and/or emergencies. In addition, all new lighting will be directed downward and on site. The approximately six existing pole-mounted floodlights used for nighttime illumination of the parking lot on the site will be removed, resulting in an overall reduction of lighting within the Proposed Project location. FAA safety lighting may also be installed on two to three new poles west of the site along the railroad tracks; however, due to the site's proximity to San Diego International Airport, similar safety lighting is typical in this setting. As previously described, the Proposed Project's existing industrial/commercial setting, includes numerous sources of overhead lighting, located both on site and off site along adjacent streets, I-5, and nearby parking facilities. As a result, new Proposed Project lighting will be a minor incremental effect that will not add a substantial new source of lighting to the area.

The Proposed Project will include a galvanized finish on steel substation structures and poles that will weather, creating a non-glare surface. The Proposed Project may also include replacing existing power line insulators with new grey polymer, non-specular insulators, which will reduce potential glare. In addition, the proposed Vine Substation site is currently being used as a long-term parking lot. By removing the automobiles from the site, the potential glare from these vehicles will be removed from the Proposed Project site. As a result, no significant impact from light and glare will occur during operation and maintenance of the Proposed Project.

4.1.4 Applicant-Proposed Measures

The Proposed Project will not result in any significant impacts related to aesthetics; therefore, no applicant-proposed measures are proposed.

4.2 AGRICULTURE AND FORESTRY RESOURCES

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				✓
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				✓
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?				✓
d) Result in the loss of forest land or conversion of forest land to non-forest use?				✓
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?				✓

4.2.0 Introduction

This section describes the agricultural resources in the vicinity of the proposed San Diego Gas & Electric Company Vine 69/12 Kilovolt Substation Project (Proposed Project) and analyzes potential impacts to these resources from construction and operation of the Proposed Project. The California Department of Conservation's (DOC's) Farmland Mapping and Monitoring Program (FMMP) has not designated any farmland within three miles of the Proposed Project. The Proposed Project will have no impact to agricultural resources because the Proposed Project components will not cross any land that is under a Williamson Act contract, zoned for agricultural use, or designated as Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Farmland of Local Importance.

4.2.1 Methodology

Research involved the review of the City of San Diego's 2008 General Plan, 2012 General Plan Amendments, and its Municipal Code. A review of the DOC's FMMP, the Joint Powers Agency of the City of San Diego and County of San Diego geographic information system (GIS) database (SanGIS) for Williamson Act parcels, and general plan and zoning maps for the Proposed Project area was also conducted. In addition, a field visit to the site was conducted on December 10, 2013 to confirm land uses.

4.2.2 Existing Conditions

The regulatory requirements and overall existing agricultural conditions of the Proposed Project are described in the following subsections.

Regulatory Background

Federal and State

Department of Conservation Farmland Mapping and Monitoring Program Important Farmland Designations

The DOC Division of Land Resource Protection generates maps depicting Important Farmlands. These farmlands are categorized according to specific criteria, including soil quality and irrigation conditions. Approximately 94 percent of the FMMP study area is based on the United States Department of Agriculture Natural Resource Conservation Service soil classification system, which evaluates both physical and chemical conditions, including soil temperature, moisture regime, pH, flooding, groundwater depth, erodibility, permeability, and sodium content. FMMP maps are updated every two years using an aerial imagery review, field reconnaissance, computer mapping analyses, and public input. The minimum land use mapping unit is 10 acres, and smaller units of land are generally incorporated into surrounding map classifications.

The DOC has established the following eight land use classifications:

- Prime Farmland: Prime Farmland has the optimum combination of physical and chemical conditions that are able to sustain long-term agricultural production. The soil quality, growing season, and moisture supply on Prime Farmlands provides conditions to produce sustained high yields. Prime Farmlands must have been used for irrigated production within four years of the mapping date.

- Farmland of Statewide Importance: Farmland of Statewide Importance is similar to Prime Farmland; however, these farmlands have minor shortcomings, such as a higher slope or decreased ability to store soil moisture. Similar to Prime Farmlands, Farmlands of Statewide Importance must have been used for irrigated production within four years of the mapping date.

- Unique Farmland: Unique Farmland has lower-quality soils and is used for the production of California's leading agricultural products. Unique Farmlands are typically irrigated, but may also include non-irrigated vineyards or orchards found in certain climatic zones. Unique Farmlands must have been cropped within four years of the mapping date.

- Farmland of Local Importance: Farmlands of Local Importance are farmlands that are vital to the local agricultural economy, as identified by each county's local advisory committee and board of supervisors.

- Grazing Land: Grazing Land is land on which existing vegetation is suitable for livestock grazing.

- Urban and Built-Up Land: Urban and Built-Up Land is defined as land that is occupied by buildings or other structures at a minimum density of one unit to 1.5 acres (or approximately six structures to 10 acres). These lands are used for development purposes, including residential, commercial, industrial, construction, public administration, institutional, transportation yards, airports, cemeteries, golf courses, sewage treatment, sanitary landfills, and water control structures.

- Other Land: Other Land includes all lands that are not in any other map category, such as waterbodies smaller than 40 acres; low-density rural developments; confined livestock, poultry, or aquaculture facilities; and brush, timber, wetland, and riparian areas not suitable for livestock grazing.

- Water: Water includes all perennial waterbodies that are a minimum of 40 acres.

For the purposes of this section, "Important Farmlands" include Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance.

Williamson Act Land Designations

The Williamson Act, also known as the California Land Conservation Act of 1965 (California Government Code [CGC] Section 51200 et seq.), preserves agricultural and open space lands from conversion to urban land uses by establishing a contract between local governments and private landowners to voluntarily restrict their land holdings to agricultural or open space use. In return, landowners receive property tax assessments based on farming or open space use, rather than assessments based on the full market property value, which is typically 20 percent to 75 percent higher. Williamson Act contracts are valid for a minimum of 10 years and are automatically renewed each year for an additional 10-year term, in the absence of a notice of nonrenewal.

The Williamson Act also allows local governments to establish Agricultural Preserves, parcels of land for which cities or counties are willing to enter into Williamson Act contracts. Agricultural Preserves must include a minimum of 100 acres and typically avoid areas in which public utility improvements and associated land acquisitions may be necessary (CGC § 51230). Although the Williamson Act does not specify compatible land uses for property located adjacent to contract lands or Agricultural Preserves, it does state that cities and counties must determine compatible land use types while recognizing that temporary or permanent population increases frequently impair or hamper agricultural operations (CGC § 51220.5).

County of San Diego

Farmland of Local Importance is land of value to the local economy, as defined by each county's local advisory committee and adopted by its board of supervisors. Farmland of Local Importance is either currently producing, or has the capability to produce agricultural products, but does not meet the criteria of Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. Authority to adopt or to recommend changes to the category of Farmland of Local Importance rests with the San Diego County Board of Supervisors.

City of San Diego

The City of San Diego's 2008 General Plan and 2012 General Plan Amendments were reviewed for agricultural resource policies that are relevant to the Proposed Project. None were identified within these plans.

San Diego Unified Port District

The Proposed Project area is subject to the regulations and policies contained within the San Diego Unified Port District's Port Master Plan; however, this plan does not contain any regulations or policies that address agricultural uses.

Agricultural Setting

The Proposed Project is not located on and will not cross any Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, or land under a Williamson Act contract. None of the Proposed Project area is under active crop cultivation nor is it used for livestock grazing. The area is not designated or zoned by the City of San Diego for agricultural uses.

4.2.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Impacts to agricultural resources would be considered significant if the Proposed Project:

- Converts Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use permanently or for a long period of time
- Conflicts with existing zoning for agricultural use
- Conflicts with a Williamson Act contract such that it must be cancelled
- Involves other changes in the existing environment, which—due to their location or nature—could result in the permanent or long-term conversion of farmland to a non-agricultural use

Question 4.2a – Farmland Conversion – *No Impact*

The Proposed Project is not located on nor does it span any land designated as Prime Farmland, Farmland of Statewide Importance, Unique Farmland, or Farmland of Local Importance. As a result, no impact will occur.

Question 4.2b – Zoning or Williamson Act Contract Conflicts – *No Impact*

The Proposed Project is not located in nor does it span any land zoned for agricultural use under a Williamson Act contract. Therefore, there will be no conflicts with agricultural zoning or Williamson Act contracts, and no impact will occur.

Question 4.2c – Other Farmland Conversion – *No Impact*

The Proposed Project is not located on nor does it span any land used for agricultural purposes or with the potential to be used for agriculture. Therefore, there will be no conversion of farmland to a non-agricultural use as a result of the Proposed Project, and there will be no impact.

Question 4.2d – Loss or Conversion of Forest Land – *No Impact*

The Proposed Project is not located on nor does it span any land zoned for forest or timberland use or with the potential to be rezoned for forest or timberland use. Therefore, there will be no conversion of forest land to a non-forest use as a result of the Proposed Project, and there will be no impact.

Question 4.2e – Other Farmland or Forest Land Conversion – *No Impact*

The Proposed Project does not have the potential to convert any other farmland or forest land to a non-agricultural or non-forest use. Therefore, there will be no impact.

4.2.4 Applicant-Proposed Measures

Because the Proposed Project will have no impact on agricultural resources, no applicant-proposed measures are proposed.

4.3 AIR QUALITY

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?			✓	
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			✓	
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?			✓	
d) Expose sensitive receptors to substantial pollutant concentrations?			✓	
e) Create objectionable odors affecting a substantial number of people?			✓	

4.3.0 Introduction

This section describes the existing air quality within the San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) area and evaluates the potential air quality impacts associated with construction and operation of the Proposed Project. Although some temporary impacts will result during construction, operation, and maintenance activities, the potential air quality impacts from the Proposed Project will be less than significant with implementation of SDG&E's ordinary construction restrictions.

4.3.1 Methodology

The existing air quality within San Diego County was researched using data obtained from the San Diego County Air Pollution Control District's (SDAPCD's) network of air quality monitoring stations. Recent regulations and guidance documents from the California Air Resources Board (CARB), California Public Utilities Commission, California Energy Commission, and the SDAPCD were also reviewed.

The majority of the Proposed Project's air emissions were assessed by estimating emission rates from construction, operation, and maintenance activities, and then comparing them to established significance criteria. In other cases, such as the odor and sensitive receptor analysis, the impact

assessment was based on subjective criteria, including experience with similar projects. Air pollutant emission rates were estimated using the publicly available software California Emissions Estimator Model (CalEEMod). This computer model allows users to generate estimates of construction and operational emissions of various pollutants, including inhalable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), carbon monoxide (CO), reactive organic gases (ROGs), sulfur oxides (SO_x), oxides of nitrogen (NO_x), and carbon dioxide. CalEEMod also allows users to input minimization measures and evaluate their effects on emission rates.

Diesel particulate matter (DPM) and other particulate matter (PM) are expected to be the two primary pollutants during construction of the Proposed Project, primarily from on- and off-road construction vehicles and soil-disturbing activities. DPM emissions can be inferred from the $PM_{2.5}$ modeling results.

The primary operation and maintenance emissions will result from maintenance vehicle travel to and from the Proposed Project area and heavy equipment use during repair activities. Similar to the construction phase, DPM and PM will be the two primary pollutants.

4.3.2 Existing Conditions

This section describes the regulations and regulatory agencies applicable to air quality for the Proposed Project, regional climate and meteorology, and existing air quality conditions in the area.

Regulatory Background

Federal

The 1970 federal Clean Air Act (CAA) established national ambient air quality standards (AAQS) for six pollutants: CO, ozone (O_3), PM_{10}, nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead. These six criteria pollutants are known to have adverse impacts on human health and the environment. To protect human health and the environment, the United States (U.S.) Environmental Protection Agency (EPA) has set primary and secondary maximum ambient thresholds. The primary thresholds were set to protect human health, particularly that of children and the elderly, as well as individuals that suffer from chronic lung conditions (e.g., asthma and emphysema). The secondary standards were set to protect the natural environment and prevent further deterioration of animals, crops, vegetation, and buildings. The combined primary and secondary standards are termed the National AAQS (NAAQS).

The 1977 CAA required each state to develop and maintain a State Implementation Plan (SIP) for each criteria pollutant that exceeds ambient air quality standards. The SIP serves as a tool to reduce pollutants that are known to cause impacts that exceed the ambient thresholds and to achieve compliance with the NAAQS. In 1990, the CAA was amended to strengthen regulation of both stationary and mobile emission sources for the criteria pollutants.

In July 1997, the U.S. EPA developed new health-based NAAQS for O_3 and PM_{10}. However, these standards were not fully implemented until 2001, after the resolution of several lawsuits. The new federal O_3 standard of 0.08 parts per million (ppm), established in 1997, was based on a longer averaging period (eight hours versus one hour), recognizing that prolonged exposure to

O_3 is more damaging. In March 2008, the EPA further lowered the eight-hour O_3 standard from 0.08 ppm to 0.075 ppm. The new federal PM standard is based on finer particles (2.5 microns and smaller versus 10 microns and smaller), recognizing that finer particles may have a higher residence time in the lungs and contribute to greater respiratory illness. In February 2007, the NO_2 AAQS was amended to lower the existing one-hour standard of 0.25 ppm to 0.18 ppm, which is not to be exceeded, and established a new annual standard of 0.030 ppm, which is also not to be exceeded. Table 4.3-1: State and Federal Ambient Air Quality Standards contains a list of the NAAQS and California Ambient Air Quality Standards (CAAQS).

State

The California CAA of 1988 requires air districts to develop and implement strategies to attain CAAQS. For some pollutants, the California standards are more stringent than the national standards. Regional air quality management districts, such as the SDAPCD, had to prepare an air quality plan specifying how federal and state standards would be met.

CARB enforces the CAAQS and works with the state's Office of Environmental Health Hazard Assessment (OEHHA) in identifying toxic air contaminants (TACs) and enforcing rules related to TACs, including the Air Toxic Hot Spots Information and Assessment Act of 1987. Enacted to identify toxic air contaminant hot spots where emissions from specific sources may expose individuals to an elevated risk of adverse health effects, the act requires that business or other establishments identified as significant sources of toxic emissions provide the affected population with information about health risks posed by the emissions.

CARB also regulates mobile emission sources in California—such as construction equipment, trucks, and automobiles—and oversees the air districts. Relevant programs related to oversight of mobile source emissions include the Off-Road and On-Road Mobile Sources Emission Reduction programs, the Portable Equipment Registration Program (PERP), and the Airborne Toxic Control Measure for DPM from Portable Engines. The Mobile Sources Emission Reduction programs are aimed at reductions of NO_x, volatile organic compounds (VOCs), CO, and PM_{10}. CARB has also adopted specific control measures for the reduction of DPM from off-road, in-use diesel vehicles (rated 25 horsepower and higher), such as back hoes, dozers, and earthmovers used in construction projects. Additional DPM control measures are also in place for heavy-duty, on-road, diesel trucks operated by public utilities and municipalities. The PERP and Airborne Toxic Control Measure for DPM from Portable Engines provide for statewide registration and control of DPM from portable engines rated 50 horsepower and higher.

San Diego County Air Pollution Control District

The air districts are primarily responsible for regulating stationary emission sources at industrial and commercial facilities within their respective geographic areas and for preparing the air quality plans that are required under the federal and California CAAs. The SDAPCD is the primary agency responsible for planning, implementing, and enforcing federal and state ambient standards in San Diego County. The plans, rules, and regulations presented in the following subsections apply to all sources in the jurisdiction of the SDAPCD.

Table 4.3-1: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	California Standard	Federal Standard	
			Primary	Secondary
O_3	1 hour	0.09 ppm (180 micrograms per cubic meter [µg/m^3])	Not Applicable (NA)	NA
	8 hours	0.070 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3)	0.075 ppm (147 µg/m^3)
PM_{10}	24 hours	50 µg/m^3	150 µg/m^3	150 µg/m^3
	Annual arithmetic mean	20 µg/m^3	50 µg/m^3	50 µg/m^3
$PM_{2.5}$	24 hours	NA	35 µg/m^3	35 µg/m^3
	Annual arithmetic mean	12 µg/m^3	15 µg/m^3	15 µg/m^3
CO	1 hour	20 ppm (23 milligrams per cubic meter [mg/m^3])	35 ppm (40 mg/m^3)	NA
	8 hours	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	NA
	8 hours (Lake Tahoe)	6 ppm (7 mg/m^3)	NA	NA
NO_2	1 hour	0.18 ppm (339 µg/m^3)	NA	NA
	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	0.053 ppm (100 µg/m^3)
SO_2	1 hour	0.25 ppm (655 µg/m^3)	NA	NA
	3 hours	NA	NA	0.5 ppm (1,300 µg /m^3)
	24 hours	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)	NA
	Annual arithmetic mean	NA	0.030 ppm (80 µg/m^3)	NA
Lead	30 days	1.5 µg/m^3	NA	NA
	Rolling 3 months	NA	0.15 µg/m^3	0.15 µg/m^3
	Quarterly	NA	1.5 µg/m^3	1.5 µg/m^3

Sources: CARB 2014d; EPA 2014b

Table Notes:
1. California standards for O_3, CO (except Lake Tahoe), SO_2 (one hour and 24 hours), NO_2, suspended PM—PM_{10} and $PM_{2.5}$—and visibility reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. NAAQS (other than O_3, PM, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth-highest eight-hour concentration in a year—averaged over three years—is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current federal policies.
3. Concentration expressed first in units used to promulgate the standard. Equivalent units given in parentheses are based on a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; "ppm" in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent procedure that can be shown to the satisfaction of CARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.
8. CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects established. These actions allow for implementation of control measures at levels below the ambient concentrations specified for these pollutants.
9. National lead standard, rolling three-month average; final rule signed October 15, 2008.

San Diego County Air Pollution Control District Air Quality Plans

The SDAPCD's air quality plans collectively provide an overview of the region's air quality and air pollution sources and identify the pollution-control measures needed to expeditiously attain and maintain air quality standards. The SDAPCD's air quality plans include the San Diego Regional Air Quality Strategy (RAQS) and the San Diego portion of the California SIP, which address state and federal requirements, respectively.

Ozone Air Quality Management Plan

The SDAPCD SIP predicts that state and local programs will allow San Diego County to reach attainment status for the previously applicable 0.08 ppm federal eight-hour O_3 AAQS (per the SIP submitted to the EPA in June 2007). It is anticipated that the EPA will designate San Diego County as a nonattainment area for the new 0.075 ppm eight-hour O_3 standard in the future. The SDAPCD will have to submit an updated SIP to address the new stringent standard at that time.

The SDAPCD maintains the RAQS, which acts as a road map demonstrating how the district will eventually meet the state O_3 AAQS. The RAQS details the measures and regulations that focus on managing and reducing O_3 precursors, such as NO_x and VOCs. The RAQS control measures concentrate on stationary sources that are under the SDAPCD's jurisdiction; however, all emission sources and control measures are included, such as any under the jurisdiction of CARB (e.g., on-road motor vehicles, off-road vehicles and equipment, and consumer products) and U.S. EPA (e.g., aircraft, ships, trains, and pre-empted off-road equipment).

Particulate Matter Air Quality Management Plan

The CCAA does not require local districts to establish an air quality management plan for state PM_{10} nonattainment, but the SDAPCD has prepared a report entitled Measures to Reduce Particulate Matter in San Diego County. The SDAPCD is considering rulemaking for source category-specific PM control measures for emissions from residential wood combustion and from fugitive dust generated at construction sites and from unpaved roads.

San Diego County Air Pollution Control District Regulation IV – Prohibitions, Rule 50 – Visible Emissions

This rule prohibits any activity that will create air contaminant emissions darker than 20-percent opacity for more than an aggregate of three minutes in any consecutive 60-minute time period.

San Diego County Air Pollution Control District Regulation IV – Prohibitions, Rule 51 – Nuisance

This regulation prohibits any activity that will discharge air contaminants that cause or have a tendency to cause injury, detriment, nuisance, or annoyance to people and the public or damage to any business or property.

San Diego County Air Pollution Control District Regulation IV – Prohibitions, Rule 55 – Fugitive Dust Control

This regulation prohibits any activity that will discharge visible dust emissions into the atmosphere beyond the property line bounding the activity for more than three minutes during

any 60-minute period. This regulation also prohibits visible roadway dust due to track-out or carry-out.

San Diego County Air Pollution Control District Rule XV – Federal Conformity

The federal conformity rule prohibits any federal actions that may be inconsistent with the SDAPCD's efforts to achieve attainment with the NAAQS.

Regional Climate and Meteorology

Climate in the San Diego Air Basin (SDAB) is generally warm, with low annual rainfall occurring mostly during the winter months. Climate plays an important role in the air quality of the SDAB. When cool, moist air from the coast travels toward the higher elevations, a temperature inversion can occur. This inversion layer prevents polluted air from rising and dispersing. According to the SDAPCD, most air quality exceedances are recorded on the lower mountain slopes that experience an inversion layer.

Local meteorological conditions in the vicinity of the Proposed Project conform to the regional pattern of strong onshore winds by day (especially in summer) and weak offshore winds at night (particularly during the winter). These local wind patterns are driven by the temperature difference between the ocean and the warm interior topography. In the summer, moderate breezes between eight and 12 miles per hour blow onshore and up through the valley from the southwest by day. Light onshore breezes may continue overnight when the land remains warmer than the ocean. In the winter, the onshore flow is weaker and the wind flow reverses to blow from the northeast in the evening as the land becomes cooler than the ocean.

The climate of the City of San Diego, as with all of Southern California, is largely controlled by the strength and position of the Pacific High. This high-pressure ridge over the West Coast creates a repetitive pattern of frequent early morning cloudiness, hazy afternoon shine, clean daytime onshore breezes and little temperature change throughout the year. Limited rainfall occurs in the winter as the fringes of mid-latitude storms occasionally move through the area. Average temperatures in January range from 47 degrees Fahrenheit (°F) at night to 63°F during the day. The warmest month is August, when the high temperatures average 74°F. Annual rainfall is approximately 10 inches in the Proposed Project area.

Air Quality

Criteria Air Pollutants

O_3, CO, NO_2, SO_2, lead, PM_{10}, and $PM_{2.5}$ are all criteria air pollutants (CAPs) that are regulated in California. Non-methane ethane VOCs, also referred to as ROGs, are also regulated as precursors to the formation of O_3. These criteria pollutants and their effects on humans are discussed in the following subsections.

Ozone

O_3 is a colorless gas that is not directly emitted as a pollutant, but is formed when hydrocarbons and NO_x react in the presence of sunlight. Low wind speeds or stagnant air mixed with warm temperatures typically provide optimum conditions for the formation of O_3. Because O_3 formation does not occur quickly, O_3 concentrations often peak downwind of the emission

source. As a result, O_3 is of regional concern as it impacts a larger area. When inhaled, O_3 irritates and damages the respiratory system.

Particulate Matter

PM, which is defined as particles suspended in a gas, is often a mixture of substances, including metals, nitrates, organic compounds, and complex mixtures, such as diesel exhaust and soil. PM can be traced back to both natural and man-made sources. The most common sources of natural PM are dust and fires, while the most common man-made source is the combustion of fossil fuels.

PM causes irritation to the human respiratory system when inhaled. The extent of the health risks due to PM exposure can be determined by the size of the particles. The smaller the particles, the deeper they can be deposited in the lungs. PM is often grouped into two categories—inhalable PM less than 10 microns in diameter (PM_{10}) and fine PM less than 2.5 microns in diameter ($PM_{2.5}$).

Carbon Monoxide

CO is a colorless, odorless, and tasteless gas that is directly emitted as a by-product of combustion. CO concentrations tend to be localized to the source, with the highest concentrations being associated with cold, stagnant weather conditions. CO is readily absorbed through the lungs into the blood, where it reduces the ability of the blood to carry oxygen.

Nitrogen Oxides

NO_x is a generic name for the group of highly reactive gases that contain nitrogen and oxygen in varying amounts. Many types of NO_x are colorless and odorless. However, when combined with particles in the air, the common pollutant NO_2 can often be seen as a reddish-brown layer over many urban areas.

NO_x form when fuel is burned at high temperatures. Typical man-made sources of NO_x include motor vehicles, fossil-fueled electricity generation utilities, and other industrial, commercial, and residential sources that burn fuels. NO_x can harm humans by affecting the respiratory system. Small particles can penetrate the sensitive parts of the lungs and can cause or worsen respiratory disease and can aggravate existing heart conditions.

As discussed previously, O_3 is formed when NO_x and VOCs react with sunlight.

Sulfur Oxides

SO_x are formed when sulfur-containing materials are processed or burned. SO_x sources include industrial facilities (e.g., petroleum refineries and cement manufacturing and metal processing facilities), locomotives, large ships, and some non-road diesel equipment.

A wide variety of health and environmental impacts are associated with SO_x because of the way it reacts with other substances in the air. A number of people are particularly sensitive to SO_x emissions, including children, the elderly, people with asthma, and people with heart or lung disease. When inhaled, these particles gather in the lungs and contribute to increased respiratory symptoms and disease, difficulty breathing, and premature death.

Volatile Organic Compounds

VOCs (or ROGs) are a group of chemicals that react with NO_x and hydrocarbons in the presence of heat and sunlight to form O_3. Examples of VOCs include gasoline fumes and oil-based paints. This group of chemicals does not include methane or other compounds determined by the U.S. EPA to have negligible photochemical reactivity.

Air Quality Designations

Three air quality designations can be given to an area for a particular pollutant:

- Nonattainment: This designation applies when air quality standards have not been consistently achieved.
- Attainment: This designation applies when air quality standards have been achieved.
- Unclassified: This designation applies when insufficient monitoring data exists to determine a nonattainment or attainment designation.

The current CAAQS and NAAQS attainment status is provided in Table 4.3-2: SDAPCD Attainment Status. The SDAPCD is currently designated as a nonattainment area for O_3 and PM.

Table 4.3-2: SDAPCD Attainment Status

Criteria Air Pollutants	State	Federal
O_3 (eight-hour)	Nonattainment	Nonattainment
$PM_{2.5}$	Nonattainment	Unclassified/Attainment
PM_{10}	Nonattainment	Unclassified
CO	Attainment	Unclassified/Attainment
NO_2	Attainment	Unclassified/Attainment
SO_2	Attainment	Attainment
Sulfates	Attainment	NA
Lead	Attainment	Attainment
Hydrogen Sulfide	Unclassified	NA
Visibility Reducing Particles	Unclassified	NA

Source: CARB 2014c

Toxic Air Contaminants

TACs are the listed toxic pollutants as established by OEHHA. Under Assembly Bill 1807, CARB is required to use certain criteria in prioritizing, identifying, and controlling air toxics. In selecting substances for review, CARB must consider pollutants that may pose a threat to human health or cause or contribute to serious illnesses or death. For many TACs, no threshold level exists below which adverse health impacts may not be expected to occur. This contrasts with the CAPs, for which acceptable levels of exposure can be determined and for which the federal and state governments have set AAQS.

PM emissions generated by diesel combustion, or DPM, are of particular concern in California. In 1998, the OEHHA completed a 10-year comprehensive human health assessment of diesel exhaust. The results of this assessment formed the basis for CARB to formally identify DPM as a TAC that poses a threat to human health. Because no established AAQS exist for TACs, they are managed on a case-by-case basis, depending on the quantity and type of emissions and the proximity of potential receptors. DPM emissions result from a wide variety of sources, including on-road and off-road vehicles and stationary and portable internal combustion engines. In California, diesel internal combustion engines were estimated to generate 28,000 tons of PM emissions in 2000.

Ambient Air Quality

Violations of NAAQS and CAAQS for O_3, PM, and CO have occurred historically in the Proposed Project area. The frequency of violations and current air quality conditions at the two monitoring sites nearest to the Proposed Project area are summarized for O_3, PM_{10}, and $PM_{2.5}$ in Table 4.3-3: Recent Air Quality Concentrations and Table 4.3-4: Frequency of Air Quality Standard Violations.[1] As shown in these tables, the air quality in the surrounding areas has been relatively stable over the past five years and has improved in some cases.

Sensitive Receptors

Some exposed population groups—including children, the elderly, and the ill—can be especially vulnerable to airborne chemicals and irritants and are termed "sensitive receptors." In addition, due to sustained exposure durations, all persons located within residential areas are considered to be sensitive receptors. The area is characterized by light- and medium-industrial and office uses, parking lots, and rental car facilities. The nearest sensitive receptors to the Proposed Project site are residential neighborhoods located approximately 450 feet east of the proposed Vine Substation. Interstate (I-) 5, a major transportation corridor in San Diego County, separates the Proposed Project site from these receptors. Section 4.10 Land Use provides more information about residences in close proximity to the Proposed Project components.

4.3.3 Impacts

Significance Criteria

San Diego County Air Pollution Control District Thresholds

To determine whether a significant impact will occur during construction, the SDAPCD informally recommends quantifying construction emissions and comparing them to significance thresholds (pounds per day) found in the SDAPCD regulations for stationary sources (pursuant to Rule 20.1, et seq.) and shown in Table 4.3-5: Air Quality Significance Thresholds. If emissions during Proposed Project construction exceed the thresholds that apply to stationary sources, then construction activities will have the potential to violate air quality standards or contribute substantially to existing violations.

[1] The Overland monitoring station is located approximately 7.2 miles northeast of the Proposed Project area at 5555 Overland Drive in San Diego. The Beardsley monitoring station is located approximately 6.5 miles north-northwest of the Proposed Project area at 1110A Beardsley Street in San Diego.

Table 4.3-3: Recent Air Quality Concentrations

Monitoring Site	Year	O_3, Maximum 1-hour (ppm)	PM_{10}, Maximum 24-hour ($\mu g/m^3$)	$PM_{2.5}$, Maximum 24-hour ($\mu g/m^3$)

* EPA "Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards" published September 8, 2005. Also used by the South Coast Air Quality Management District (SCAQMD).
** Threshold for VOCs based on the threshold of significance for VOCs from the SCAQMD for the Coachella Valley.
*** Threshold based on 75 pounds per day multiplied by 365 days per year and divided by 2,000 pounds per ton.

California Environmental Quality Act Guidelines

In addition to the previously mentioned criteria, Appendix G of the California Environmental Quality Act (CEQA) Guidelines determines that impacts to air quality would be significant if the Proposed Project:

- Conflicts with or obstructs implementation of the applicable air quality plan
- Violates any air quality standard or contributes substantially to an existing or projected air quality violation
- Results in a cumulatively considerable net increase of any criteria pollutant for which the Proposed Project region is classified as nonattainment under an applicable federal or state ambient air quality standard
- Exposes sensitive receptors to substantial pollutant concentrations
- Creates objectionable odors affecting a substantial number of people

Question 4.3a – Applicable Air Quality Plan Conflicts – *Less-than-Significant Impact*

A potentially significant impact on air quality will occur if the Proposed Project conflicts with or obstructs the implementation of the applicable air quality plan. Although the Proposed Project will result in CAP emissions within the basin, the primary focus is that the Proposed Project's emissions are properly anticipated in the regional air quality planning process and reduced where feasible. To determine if the emissions were captured during the air quality planning process, it is necessary to assess the Proposed Project's consistency with the RAQS. Consistency with the RAQS is determined by evaluating if the Proposed Project's emissions exceed the CAP

thresholds established by the SDAPCD and if the Proposed Project will result in growth that has been anticipated.

The CalEEMod computer model was used to simulate the anticipated emissions during construction using site-specific information to generate emission rates based on the Proposed Project's anticipated size, schedule, land use, and construction methods. Using this data, the model calculated the maximum daily emissions for a range of pollutants. The CalEEMod input and output are provided in Attachment 4.3–A: CalEEMod Input and Output Files.

PM and NO_x are generally the primary air pollutants resulting from construction activities. The simulated PM emissions are the composite of two types of sources—fugitive dust and tailpipe emissions. Typical fugitive dust sources include earth-moving activities (e.g., grading of the substation pad and excavation of the underground duct bank trenches), the loading and unloading of fill and spoil materials, and vehicle travel across unpaved areas. Tailpipe emissions result from the combustion of fossil fuels in both off-road construction equipment and on-road vehicles. The results of the CalEEMod simulations included in Attachment 4.3–A: CalEEMod Input and Output Files indicate that the peak unmitigated emissions will be in compliance with all applicable SDAPCD thresholds, as indicated in Table 4.3-6: Peak Daily Unmitigated Construction Emissions.

To reduce impacts to the extent possible, SDG&E will implement the following air emissions control measures as part of its ordinary construction restrictions as described in Chapter 3 – Project Description:

- **Fugitive Dust Control.** All unpaved construction areas will be watered up to two times daily during construction to reduce dust emissions and to meet SDAPCD Rule 55 requirements. SDG&E or its contractor will keep the construction area sufficiently dampened to control dust caused by construction and hauling, and will provide at all times reasonable dust control of areas subject to windblown erosion.

- **Bulk Material Transport.** All loads will be secured by covering or be sufficiently watered and use of at least two feet of freeboard to avoid carry-over.

- **Equipment Emissions.** SDG&E or its contractor will maintain and operate construction equipment to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues will have their engines turned off after five minutes when not in use. Construction activities will be phased and scheduled to avoid emission peaks, and equipment use will be curtailed during second-stage smog alerts.

- **Volatile Organic Compound (VOC) Reduction.** Low- and non-VOC-containing coatings, sealants, adhesives, solvents, asphalt, and architectural coatings will be used to reduce VOC emissions.

These control measures were entered into CalEEMod, as appropriate, and the resulting mitigated emissions are presented in Table 4.3-7: Peak Daily Mitigated Construction Emissions. As a result, with the implementation SDG&E's ordinary construction restrictions, the construction phase of the Proposed Project will not exceed the applicable SDAPCD thresholds.

Table 4.3-6: Peak Daily Unmitigated Construction Emissions

Year	Emissions (pounds per day)					
	$PM_{2.5}$	PM_{10}	NO_x	SO_x	CO	VOC
2016	14.37	26.26	185.45	0.18	124.01	16.76
2017	5.27	6.68	103.86	0.14	73.59	10.02
Threshold	55	100	250	250	550	75
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Table 4.3-7: Peak Daily Mitigated Construction Emissions

Year	Emissions (pounds per day)					
	$PM_{2.5}$	PM_{10}	NO_x	SO_x	CO	VOC
2016	11.63	21.27	185.45	0.18	124.01	16.76
2017	5.27	6.68	103.86	0.14	73.59	10.02
Threshold	55	100	250	250	550	75
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

The Proposed Project is not a trip-generating project, such as a residential or commercial development, nor will it result in population growth. Once construction of the Proposed Project has been completed, emissions will be relatively low, resulting only from scheduled maintenance and operation activities. The anticipated emissions from operation and maintenance activities were simulated using CalEEMod and the results are presented in Table 4.3-8: Peak Daily Operational Emissions. As indicated, all emissions will be well below the applicable thresholds. Therefore, the Proposed Project will not conflict with or obstruct implementation of the applicable air quality plan, and thus will have a less-than-significant impact in regard to plan consistency.

Question 4.3b – Air Quality Standard Violations

Construction – Less-than-Significant Impact

The site development phase of the Proposed Project will require various pieces of heavy equipment, including bulldozers, excavators, loaders, and compactors. Street-legal haul trucks will be employed during material export or import activities. In addition, portable cranes and heavy hauling trucks will be employed for equipment delivery and installation. Concrete trucks, back hoes, crew trucks, and pick-up trucks will arrive and depart the proposed Vine Substation site during installation of foundations, ground grid, and underground ducts. Until the substation is

energized, crew trucks, boom trucks, and pick-up trucks will arrive and depart from the site daily for construction activities, testing and check-out, final power line tie-ins, and circuit cabling.

Table 4.3-8: Peak Daily Operational Emissions

Category	Emissions (pounds per day)					
	$PM_{2.5}$	PM_{10}	NO_x	SO_x	CO	VOC
Off-Road	0.05	0.06	1.60	< 0.01	2.16	0.10
Threshold	55	100	250	250	550	75
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

It is anticipated that approximately 48 workers will be on site at the proposed Vine Substation at any one time during construction. A similar number of workers will be employed to install the 69 kV loop-in and 12 kV distribution relocation. Daily transportation of construction workers is not expected to cause a significant effect on air quality, because no more than 100 workers will be in any one location at any time during the peak of construction and emissions will not exceed any applicable threshold. In addition, the number of trips generated will be minimal and constitute an insignificant percentage of current daily volumes in the area, as described in Section 4.16 Transportation and Traffic. Moreover, SDG&E will encourage carpooling during construction.

Construction of the Proposed Project will generate short-term air quality impacts during grading and construction operations. CalEEMod was used to simulate emissions from construction activities based on the schedule and construction equipment lists provided in Chapter 3 – Project Description. Variables factored into estimating the total construction emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials transported on site or off site. The results of this simulation are presented in Table 4.3-6: Peak Daily Unmitigated Construction Emissions.

As described in response to Question 4.3a, SDG&E's ordinary construction restrictions were entered into the CalEEMod model, as appropriate, and the resulting mitigated emissions are presented in Table 4.3-7: Peak Daily Mitigated Construction Emissions. A detailed discussion of the Proposed Project's potential to impact air quality from fugitive dust, construction equipment exhaust, and TAC sources is provided in the subsections that follow.

Fugitive Dust Emissions

Construction activities are a source of fugitive dust (PM_{10}) emissions that have the potential to temporarily impact local air quality. In addition, fugitive dust may be a nuisance to those living and working in the Proposed Project area. Fugitive dust emissions are associated with land clearing, excavation, cut and fill, and truck travel on unpaved roadways. Fugitive dust emissions can vary substantially from day to day, depending on the level of activity, specific operations,

and weather conditions. Fugitive dust from grading and construction is expected to be short-term and will cease when these activities are completed.

Fugitive dust emissions were simulated using CalEEMod and the resulting maximum daily unmitigated and mitigated emissions are presented in Table 4.3-9: Maximum Daily Fugitive Dust Emissions from Construction. As shown, the unmitigated emissions will be below the applicable thresholds. Nonetheless, SDG&E will implement its ordinary construction restrictions described in response to Question 4.3a to further reduce these emissions. These measures include adherence to ordinary construction restrictions (e.g., watering inactive and perimeter areas, cleaning track-out, and containing dirt and dust within the Proposed Project area) and compliance with the SDAPCD's Fugitive Dust Rule 55. As a result, impacts from fugitive dust will be less than significant.

Table 4.3-9: Maximum Daily Fugitive Dust Emissions from Construction

Year	Unmitigated (pounds per day)		Mitigated (pounds per day)	
	$PM_{2.5}$	PM_{10}	$PM_{2.5}$	PM_{10}
2016	14.37	26.26	11.63	21.27
2017	5.27	6.68	5.27	6.68
Threshold	55	100	55	100
Threshold Exceeded?	**No**	**No**	**No**	**No**

Construction Equipment and Worker Vehicle Exhaust

Exhaust emissions from construction activities include emissions associated with transporting machinery and supplies to and from the Proposed Project area, emissions produced on site as the equipment is used, and emissions from trucks transporting fill material to the Vine Substation site. Emitted pollutants will include CO, VOC, NO_x, PM_{10}, and $PM_{2.5}$. As presented in Table 4.3-6: Peak Daily Unmitigated Construction Emissions, the maximum daily uncontrolled emissions for each year of construction of the Proposed Project will not exceed the SDAPCD's standards for all pollutants. Therefore, impacts associated with construction will be less than significant.

Toxic Air Contaminants

DPM will be emitted from on- and off-road vehicles that use diesel as fuel during the construction phase of the Proposed Project. Potential health effects associated with exposure to DPM are long-term and are evaluated on the basis of a lifetime of exposure (70 years). Because construction activities will be short-term, emissions will not impact any sensitive receptors for any length of time.

CARB has adopted airborne toxic control measures (ATCMs) applicable to off-road diesel equipment and portable diesel engines with a rating of 50 brake horsepower or greater. The purpose of these ATCMs is to reduce emissions of PM from engines subject to the rule. The

ATCMs require diesel engines to comply with PM emissions limitations on a fleet-averaged basis. CARB has also adopted an ATCM that limits diesel-fueled commercial motor vehicle idling. The rule applies to motor vehicles with gross vehicular weight ratings greater than 10,000 pounds that are licensed for on-road use. The rule restricts vehicles from idling for more than five minutes at any location, with exceptions for idling that may be necessary in the operation of the vehicle.

All off-road diesel equipment, on-road heavy-duty diesel trucks, and portable diesel equipment used for the Proposed Project will meet the state's applicable ATCMs for control of diesel PM or NO_x in the exhaust (e.g., ATCMs for portable diesel engines, off-road vehicles, and heavy-duty on-road diesel trucks, and five-minute diesel engine idling limits) that are in effect during implementation of the Proposed Project. The mobile fleets used in the Proposed Project are expected to be in full compliance with these ATCMs. This will ensure that pollutant emissions in diesel engine exhaust do not exceed applicable federal or state air quality standards. As a result, impacts will be less than significant.

Operation and Maintenance – No Impact

As shown in Table 4.3-8: Peak Daily Operational Emissions, operation and maintenance of the Proposed Project will generate limited CAP emissions and will be in compliance with all applicable thresholds. Therefore, the operation and maintenance of the Proposed Project will not result in any impacts related to existing air quality standards.

Question 4.3c – Criteria Pollutant Increases

Construction – Less-than-Significant Impact

As shown previously in Table 4.3-6: Peak Daily Unmitigated Construction Emissions and Table 4.3-7: Peak Daily Mitigated Construction Emissions, the construction of the Proposed Project will lead to a small, temporary increase in CAPs. SDG&E ordinary construction restrictions will be implemented, which include minimizing vehicle idling time and controls for dust emissions, to reduce the impacts of the construction. As a result, the temporary criteria pollutant emissions will not exceed the applicable SDAPCD thresholds and impacts will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Operational emissions were simulated using CalEEMod, assuming the levels of traffic described in Section 3.7 Operation and Maintenance. The results of these simulations are presented in Table 4.3-8: Peak Daily Operational Emissions. These increases in CAPs will be significantly less than those projected for the construction phase, and will be well below the acceptable significance thresholds. As a result, CAP increases due to operation and maintenance of the Proposed Project will be considered less than significant.

Question 4.3d – Sensitive Receptor Exposure – *Less-than-Significant Impact*

The Proposed Project site is located in an industrial and commercial area and in proximity to I-5 and Kettner Boulevard. Although sensitive receptors have been identified within 350 feet of the proposed substation, impacts to these receptors will be less than significant with the implementation of SDG&E's ordinary construction restrictions described in response to Question 4.3a. These restrictions include reducing idling time and implementing dust control

measures. In addition, emissions resulting from operation and maintenance activities associated with the Proposed Project were also determined to be in compliance with the applicable SDAPCD thresholds. Neither the construction nor operation and maintenance phases of the Proposed Project will contribute to the violation of an existing air quality standard. As a result, the Proposed Project will have a less-than-significant impact to sensitive receptors.

Question 4.3e – Odor

Construction – Less-than-Significant Impact

Due to the nature of the Proposed Project, odor impacts are unlikely. Typical odor nuisances include hydrogen sulfide, ammonia, chlorine, and other sulfide-related emissions. No significant sources of these pollutants will exist during construction. An additional potential source of Proposed Project-related odor is diesel engine emissions. These emissions will be temporary in nature and will be limited by the relatively small number of vehicles on site and the distance from any sensitive receptors. In addition, the Proposed Project site is located in close proximity to I-5, which supports a high volume of freeway traffic and generates odors that will be consistent with the construction equipment used during the Proposed Project. Therefore, impacts will be less than significant.

Operation and Maintenance – No Impact

Operation and maintenance activities associated with the Proposed Project will not result in detectable odors. As a result, there will be no impact.

4.3.4 Applicant-Proposed Measures

Because the Proposed Project will have a less-than-significant impact on air quality and SDG&E standard construction restrictions will be implemented, no applicant-proposed measures are proposed.

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Substation parcel size set to 1.5 acre

Construction Phase - Schedule taken from Chapter 3 - Project Description. Telecom cable installation will be conducted with the same equipment as 12 kV cable installation.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Trips and VMT - Values calculated from import and export needs.

On-road Fugitive Dust - Assume 98 percent of substation hauling trips are off pavement due to site development being conducted and the final roads not being paved.

Grading - Total area disturbed has been updated to indicate the size of the substation parcel

Vehicle Trips - Conservatively estimated an average of 10 trips per day to handle operation and maintenance.

Construction Off-road Equipment Mitigation -

Operational Off-Road Equipment - Assume 2 bucket trucks three times per year for tranmission line maintence. Remainder of maintenance is performed from on-road vehicles.

9.0 Operational Offroad

Vine 69/12 kV Substation Project

San Diego County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
User Defined Industrial	1.00	User Defined Unit	1.50	0.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	40
Climate Zone	13			**Operational Year**	2017
Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	720.49	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Substation parcel size set to 1.5 acre

Construction Phase - Schedule taken from Chapter 3 - Project Description. Telecom cable installation will be conducted with the same equipment as 12 kV cable installation.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Trips and VMT - Values calculated from import and export needs.

On-road Fugitive Dust - Assume 98 percent of substation hauling trips are off pavement due to site development being conducted and the final roads not being paved.

Grading - Total area disturbed has been updated to indicate the size of the substation parcel

Vehicle Trips - Conservatively estimated an average of 10 trips per day to handle operation and maintenance.

Construction Off-road Equipment Mitigation -

Operational Off-Road Equipment - Assume 2 bucket trucks three times per year for tranmission line maintence. Remainder of maintenance is performed from on-road vehicles.

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Substation parcel size set to 1.5 acre

Construction Phase - Schedule taken from Chapter 3 - Project Description. Telecom cable installation will be conducted with the same equipment as 12 kV cable installation.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default values set to zero. Construction equipment list taken from Chapter 3 - Project Description.

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Off-road Equipment - Default equipment set to a quantity of zero, remaining equipment taken from Chapter 3 - Project Description

Trips and VMT - Values calculated from import and export needs.

On-road Fugitive Dust - Assume 98 percent of substation hauling trips are off pavement due to site development being conducted and the final roads not being paved.

Grading - Total area disturbed has been updated to indicate the size of the substation parcel

Vehicle Trips - Conservatively estimated an average of 10 trips per day to handle operation and maintenance.

Construction Off-road Equipment Mitigation -

Operational Off-Road Equipment - Assume 2 bucket trucks three times per year for tranmission line maintence. Remainder of maintenance is performed from on-road vehicles.

4.4 BIOLOGICAL RESOURCES

Will the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States (U.S.) Fish and Wildlife Service?			✓	
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?				✓
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				✓
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			✓	
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?				✓
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				✓

4.4.0 Introduction

This section describes the biological resources in the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project), and identifies potential impacts to habitats and species that could result from the construction, operation, and maintenance of the Proposed Project. In addition, potential impacts to riparian communities, jurisdictional wetlands and waters, and migratory wildlife corridors are addressed. The SDG&E Subregional Natural Community Conservation Plan (NCCP), City of San Diego General Plan, and City of San Diego Multiple Species Conservation Program (MSCP) were also reviewed to confirm that the construction of the Proposed Project will not conflict with the aforementioned plans' goals, objectives, and policies. With the implementation of SDG&E's NCCP, which is included as an ordinary construction/operating restriction in Chapter 3 – Project Description, impacts to biological resources from the Proposed Project will be reduced to a less-than-significant level.

4.4.1 Methodology

Data regarding biological resources within the Proposed Project site[1] were obtained through a field reconnaissance survey and a literature review of applicable reference materials and reports. The primary objective of the reconnaissance-level survey was to assess the existing conditions of the biological resources in the Proposed Project site, focusing on conducting a plant and wildlife species inventory, assessing the potential occurrence of sensitive species, and determining if jurisdictional resources are present.

Literature Review

Preliminary investigations included a study of aerial photographs, United States (U.S.) Geological Survey (USGS) topographic maps, National Wetland Inventory maps, and literature and database searches. Other sources of information included the California Native Plant Society (CNPS) Inventory of Rare and Endangered Vascular Plants of California, as well as the San Diego County Bird Atlas.

All planning documents that are relevant to the Proposed Project site were reviewed, including two City of San Diego plans—the City of San Diego MSCP and City of San Diego General Plan. The SDG&E Mira Sorrento Substation Project Proponent's Environmental Assessment and the Draft Initial Study and Mitigated Negative Declaration for SDG&E's Mira Sorrento Distribution Substation Project were also reviewed.

A search of the California Natural Diversity Database (CNDDB), maintained by the California Department of Fish and Wildlife (CDFW), was conducted for the 7.5-minute USGS quadrangle spanned by the Proposed Project, as well as all surrounding quadrangles.

[1] The Proposed Project site includes all areas directly adjacent to the Proposed Project footprint. The Proposed Project footprint is defined as all areas that will be directly impacted by construction activities. This area includes the parcel that the proposed Vine Substation will be located on, portions of Kettner Boulevard and Pacific Highway where underground duct banks and associated facilities will be installed, and areas adjacent to Pacific Highway and California Street where poles associated with the 69 kV loop-in will be installed or removed.

The Carlsbad office of the U.S. Fish and Wildlife Service (USFWS) also provided a list of threatened and endangered species known to occur near or within the Proposed Project site. This list is included in Attachment 4.4-A: USFWS Species Lists.

Determination of the potential occurrence for listed, sensitive, or noteworthy species was based on known ranges and habitat preferences for the species, species occurrence records from the CNDDB, and species occurrence records from other sites in the vicinity of the survey area.

General Biological Surveys

Insignia Environmental biologist Jeff Coward conducted a reconnaissance-level biological survey of the Proposed Project footprint on January 2, 2014. The biologist documented the dominant plant communities and potential habitat for wildlife species. He also documented plant and animal species observed directly or detected from calls, tracks, scat, nests, or other signs. The wildlife survey was performed during the day; therefore, nocturnal animals were identified by evidence that was apparent at the time of the survey. The potential for sensitive plant and animal species, determined by the presence of diagnostic habitat elements, was documented. A more detailed discussion of the reconnaissance-level biological survey is provided in Attachment 4.4-B: Biological Survey Memo.

Delineation of Jurisdictional Waters

A field investigation of the approximately 1.5-acre proposed Vine Substation site, as well as the Proposed Project footprint along Kettner Boulevard from the Vine Substation site near Vine Street to SDG&E's existing Kettner Substation near West Palm Street was conducted by Jeff Coward on January 2, 2014 to identify any jurisdictional waters regulated under the federal Clean Water Act (CWA), California Porter-Cologne Water Quality Control Act, and California Fish and Game Code Sections 1600 through 1606. Prior to conducting the site visit, aerial photographs and USGS topographic maps of the site were examined. Once on site, the Proposed Project footprint was evaluated to determine the presence of any jurisdictional areas or drainage channels. The remainder of the survey area was also examined by the biologist for the presence of potential waters of the U.S. A more detailed discussion of the field investigation is provided in Attachment 4.4-B: Biological Survey Memo.

4.4.2 Existing Conditions

Regulatory Setting

The following sections describe federal, state, and local regulations regarding biological resources that apply to the Proposed Project.

Federal

Federal Endangered Species Act

The Federal Endangered Species Act (FESA) protects plants and wildlife that are listed as endangered or threatened by the USFWS and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service. The FESA prohibits take of endangered wildlife, where "take" is defined as to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (16 U.S. Code [U.S.C.] §§ 1532(19), 1538). For

plants, this statute governs removing, possessing, maliciously damaging, or destroying any listed plant on federal land and removing, cutting, digging up, damaging, or destroying any listed plant on non-federal land in knowing violation of state law (16 U.S.C. § 1538(c)).

Under Section 7 of the FESA, federal agencies are required to consult with the USFWS if their actions, including permit approvals or funding, could adversely affect a listed species (including plants) or its critical habitat. Through consultation and the issuance of a Biological Opinion, the USFWS may issue an incidental take statement, allowing take of the species that is incidental to another authorized activity, provided that the action will not jeopardize the continued existence of the species. Section 10 of the FESA provides for issuance of incidental take permits to private parties with the development of a habitat conservation plan (HCP), such as SDG&E's NCCP.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) recognizes international treaties between the U.S. and other countries that have been accorded to protect migratory birds and any of their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. As authorized by the MBTA, the USFWS issues permits to qualified applicants for the following types of activities:

- falconry;
- raptor propagation;
- scientific collection;
- special purposes (e.g., rehabilitation, education, migratory game bird propagation, and salvage); and
- take of depredating birds, taxidermy, and waterfowl sale and disposal.

The regulations governing migratory bird permits can be found in Title 50 of the Code of Federal Regulations (CFR) Part 13 (General Permit Procedures) and Title 50 of the CFR Part 21 (Migratory Bird Permits).

Clean Water Act

The purpose of the CWA is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Section 404 of the CWA prohibits the discharge of dredge or fill material into waters of the U.S. without a permit from the U.S. Army Corps of Engineers (USACE). The definition of waters of the U.S. includes rivers, streams, estuaries, the territorial seas, ponds, lakes, and wetlands. Wetlands are defined as those areas "that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR § 328.3(b)). The U.S. Environmental Protection Agency has veto authority over the USACE's administration of the Section 404 program and may override a USACE decision with respect to permitting.

Substantial impacts to waters of the U.S. may require an Individual Permit. Projects that only minimally affect waters of the U.S. may meet the conditions of one of the existing Nationwide Permits, provided that such permits' other respective conditions are satisfied. A Water Quality Certification or waiver pursuant to Section 401 of the CWA is required for Section 404 permit

actions. For the Proposed Project, this certification or waiver will need to be issued by the San Diego Regional Water Quality Control Board (RWQCB).

State

California Endangered Species Act

The California Endangered Species Act (CESA) generally parallels the main provisions of the FESA. Section 2080 of the California Fish and Game Code prohibits the take, possession, purchase, sale, and import or export of endangered, threatened, or candidate species, unless otherwise authorized by permit or in the regulations. "Take" is defined in Section 86 of the California Fish and Game Code as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA allows for take incidental to otherwise lawful projects. State lead agencies are required to consult with the CDFW to ensure that any action they undertake is not likely to jeopardize the continued existence of any endangered or threatened species or result in destruction or adverse modification of essential habitat.

Fully Protected Species

The State of California first began to designate species as "fully protected" prior to the creation of the CESA and the FESA. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction, including fish, amphibians, reptiles, birds, and mammals. Most fully protected species have since been listed as threatened or endangered under the CESA and/or the FESA. Fully protected species may not be taken or possessed at any time (California Fish and Game Code § 4700).

Native Plant Protection Act

The Native Plant Protection Act (NPPA) of 1977 was created with the intent to "preserve, protect, and enhance rare and endangered plants in this State" (California Fish and Game Code §§ 1900 to 1913). The NPPA is administered by the CDFW, which has the authority to designate native plants as endangered or rare and to protect them from take.

California Fish and Game Code Sections 1600-1606

Sections 1601 through 1606 of the California Fish and Game Code require that a Notification of Lake or Streambed Alteration Agreement application be submitted to the CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." The CDFW reviews the proposed actions as described in the Section 1602 notification submitted by the applicant and, if necessary, prepares a Lake or Streambed Alteration Agreement that includes measures to protect affected fish and wildlife resources.

California Fish and Game Code Sections 3503, 3503.5, 3513, and 3800

The State of California has incorporated the protection of birds into Sections 3503, 3503.5, 3513, and 3800 of the California Fish and Game Code.

Porter-Cologne Water Quality Control Act

The intent of the Porter-Cologne Water Quality Control Act is to protect water quality and the beneficial uses of water, and applies to both surface and ground water. Under this law, the State Water Resources Control Board develops statewide water quality plans, and the RWQCBs develop basin plans, which identify beneficial uses, water quality objectives, and implementation plans. The RWQCBs have the primary responsibility to implement the provisions of both statewide and basin plans. Waters regulated under Porter-Cologne, referred to as "waters of the State," include isolated waters that are no longer regulated by the USACE. Any person discharging, or proposing to discharge, waste to waters of the State must file a Report of Waste Discharge and receive either waste discharge requirements (WDRs) or a waiver to WDRs before beginning the discharge.

Local

City of San Diego General Plan

The City of San Diego General Plan provides a framework of policies and objectives to guide long-term development. The Conservation Element portion of the City of San Diego General Plan provides biological resource policies that may be relevant to the Proposed Project, including policies for urban runoff management, protection and restoration of waterbodies, preservation of biologically diverse ecosystems, and conservation of sensitive species and their habitats.

City of San Diego Multiple Species Conservation Program

The City of San Diego uses its MSCP Subarea Plan as the basis for the implementing agreement contract between the city and the wildlife agencies and ensures implementation of the Subarea Plan. The Subarea Plan allows the city to issue take permits at the local level, and was prepared pursuant to general standards developed by the USFWS and the CDFW to meet the requirements of the California Natural Community Conservation Planning Act (NCCP Act) of 1992. The Subarea Plan is consistent with the MSCP plan and serves to implement the city's portion of the MSCP preserve.

In cooperation with the wildlife agencies, property owners, developers, and environmental groups, the City of San Diego also developed its Multi-Habitat Planning Area (MHPA). The MHPA delineates specific core biological resource areas and corridors within the city boundaries that are intended for long-term conservation; however, limited development may occur within the MHPA.

San Diego Gas & Electric Company Subregional Natural Community Conservation Plan

Under Section 10(a) of the FESA, SDG&E developed this comprehensive multiple species and habitat NCCP to effectively preserve and enhance covered sensitive species and their native habitats during operation, maintenance, and expansion of its electric and natural gas transmission system (16 U.S.C. § 1539). In addition, the NCCP is also a permit issued pursuant to California Fish and Game Code Section 2081 with an implementation agreement with the CDFW for the

management and conservation of multiple species and their associated habitats as established according to the CESA and the state's NCCP Act.[2]

The purpose of the Subregional NCCP is to establish and implement a long-term agreement between SDG&E, the USFWS, and the CDFW for the preservation and conservation of sensitive species and their habitats while allowing SDG&E to develop, install, maintain, operate, and repair the necessary facilities to provide energy services to customers living within SDG&E's service area. The NCCP does not cover major expansions of SDG&E's electric system and only covers new electric substations that will result in no more than 20 acres of habitat disturbance.

The NCCP identifies 61 Operational Protocols designed to avoid and minimize potential impacts to sensitive species and their habitats, and to provide appropriate mitigation where such impacts are unavoidable, thus ensuring survivability and conservation of protected species and their habitats. These 61 protocols, as detailed in Attachment 4.4-C: SDG&E NCCP and Operational Protocols, include provisions for personnel training, pre-activity studies, maintenance, and repair and construction of facilities, such as access roads, survey work, and emergency repairs. SDG&E's NCCP does not exempt projects subject to permits from the California Public Utilities Commission or several other federal and state agencies. Therefore, many projects—including the Proposed Project—will be subject to California Environmental Quality Act (CEQA) review. It is intended that the subsequent environmental reviews use the NCCP to evaluate the impacts to covered species and their habitats.

Under its NCCP, SDG&E performs pre-activity studies prior to field operation in a natural area and/or when work is performed off of access roads in natural areas. As the Proposed Project is not in a natural area, a pre-activity survey was not conducted. SDG&E consults with the USFWS and CDFW when impacts to narrow endemic species may occur. As described in the Implementing Agreement for the SDG&E NCCP, SDG&E, the USFWS, and the CDFW agree that for absent unforeseen circumstances, the mitigation measures provided in SDG&E's NCCP constitute the only mitigation measures that will be required for any activity covered by the NCCP when a project results in an impact to a covered species or its habitat.

The Proposed Project falls within the area where SDG&E's utility operations are governed by the NCCP. For the Proposed Project, SDG&E has adopted the mitigation measures and Operational Protocols contained in the NCCP, as detailed in Attachment 4.4-C: SDG&E NCCP and Operational Protocols. With the implementation of SDG&E's NCCP which is included as an ordinary construction/operating restriction in Chapter 3 – Project Description, SDG&E will minimize potential impacts and ensure the protection and conservation of listed and covered species and their habitats. While the Proposed Project is located within areas included in both the City of San Diego's General Plan and MSCP Subarea Plan, SDG&E's public utility activities, such as the Proposed Project, are generally not subject to the discretionary regulatory jurisdiction of such local governments; therefore, they are not governed by the terms and conditions of such plans. However, in implementing its NCCP for the Proposed Project, SDG&E will coordinate with the City of San Diego and other jurisdictions to achieve

[2] California Fish and Game Code Sections 2081(b) and (c) allow the CDFW to issue an incidental take permit for a state-listed threatened and endangered species only if specific criteria are met. (*See also* the California Code of Regulations, Title 14, Section 783.4(a),(b)).

consistency to the extent feasible. Where consistency is not feasible, SDG&E's NCCP provides appropriate protocols and mitigation measures to protect natural community and natural resource values in these conservation-planning areas.

Physical Setting

The Proposed Project is located in the southwestern portion of the City of San Diego, approximately two miles northwest of downtown San Diego and directly adjacent to and east of the San Diego International Airport. The majority of the Proposed Project site is characterized by light- and medium-industrial office uses, parking lots, and rental car facilities.

The proposed Vine Substation site is located on the southwestern corner of the intersection of Vine Street and Kettner Boulevard, just west of Interstate (I-) 5 and east of Pacific Highway. The proposed Vine Substation parcel is currently a long-term airport parking lot. It is bordered to the north by Vine Street and a commercial printing business, to south by an Advantage Rental Car facility, to the east by Kettner Boulevard, and to the west by railroad tracks used by the Amtrak Pacific Surfliner, North County Transit District Coaster, and the San Diego Metropolitan Transit District Trolley. The proposed 12 kV distribution relocation and the telecommunication system extension runs along Kettner Boulevard between West Hawthorn Street and Vine Street within a public right-of-way (ROW). Existing uses along the relocated distribution circuits include I-5 to the east, and rental car facilities, offices, and airport parking lots to the west. The proposed 69 kV loop-in is located west of the proposed Vine Substation site adjacent to railroad tracks and Pacific Highway.

The elevations for the Proposed Project footprint range from 30 feet to 70 feet above mean sea level, with the lower elevations in the southwest corner of the proposed Vine Substation site. Annual average precipitation for the Proposed Project is approximately 10 inches per year, with the majority of precipitation falling between December and April. Rainfall between June and October averages less than 0.5 inch per month.

Vegetation Communities and Sensitive Habitats

The majority of the Proposed Project footprint consists of developed land. Two additional vegetation communities—ornamental vegetation and disturbed habitat—occur within the Proposed Project footprint. Vegetation and habitat type are prime factors in determining the suitability of a site for use by certain wildlife species and the occurrence of certain plant species. The following subsections provide descriptions of each habitat type and/or vegetation community and the location of each habitat within the Proposed Project footprint.

Ornamental Vegetation

Ornamental vegetation includes lands that have been planted with landscaping and are maintained on an ongoing basis. Such landscaping materials may include native and non-native plant materials; however, such manicured plantings have been artificially installed and do not naturally occur on site. At the Proposed Project site, ornamental vegetation occurs intermittently within the proposed Vine Substation site and along Kettner Boulevard, Pacific Highway, and California Street (i.e., the northern and southern edges of the Proposed Project site). This

vegetation is dominated by species such as English ivy (*Hedera helix*), Mexican fan palm (*Washintonia robusta*), pepper tree (*Schinus* sp.), and horseweed (*conyza bonariensis*).

Disturbed Habitat

Disturbed habitat includes land cleared of vegetation (e.g., dirt roads) or lands containing a preponderance of non-native plant species. This type of habitat can also include areas that are mowed or landscaped regularly and, thus, preclude the development of native vegetation communities. Disturbed habitat was observed along the ROW for the proposed 12 kV distribution relocation, 69 kV loop-in, and telecommunication system extension. In addition, a small strip of disturbed habitat was observed along the perimeter of the proposed Vine Substation site. Disturbed habitat includes all areas within the Proposed Project footprint or in the immediate Proposed Project vicinity that have been previously disturbed and have not returned to native habitat. The disturbed habitat within the Proposed Project footprint consists of little to no vegetation, although some non-native grasses were observed in these areas.

Developed Land

Developed land includes areas where permanent structures and/or pavement have been placed, which prevents the growth of vegetation, or where landscaping is cleared, tended, and maintained. Developed land occurs in the majority of the Proposed Project footprint.

General Biological Survey Results

The majority of the Proposed Project footprint consists of developed land. Developed land consists of paved roadways, existing paved parking lots, office buildings, and an existing substation. Two vegetation communities, as described previously, occur within the Proposed Project footprint—ornamental vegetation and disturbed habitat. Ornamental vegetation occurs adjacent to the proposed Vine Substation site and along Kettner Boulevard, Vine Street, Pacific Highway, and California Street. The majority of ornamental vegetation in the Proposed Project footprint and surrounding areas consists of English ivy, Mexican fan palm, pepper tree, and horseweed. Disturbed habitat was observed along the ROW for the proposed distribution circuits and along the perimeter of the proposed Vine Substation site. The disturbed habitat within the Proposed Project footprint consisted of little to no vegetation, although some non-native grasses were observed in these areas.

During the January 2 reconnaissance-level survey of the Proposed Project footprint, only one wildlife species—rock dove (*Columbia livia*)—was observed flying over the proposed Vine Substation site. This species is typical of urban areas.

Sensitive Vegetation Communities

Sensitive vegetation communities include riparian habitat or other sensitive natural communities identified in local or regional plans, policies, or regulations, or designated by the USFWS and the CDFW. No sensitive natural communities—as defined by the USACE, RWQCB, CDFW, and/or the City of San Diego—exist in the Proposed Project footprint. The Proposed Project is mostly industrial in nature, consisting of public roads, light- and medium-industrial office uses, parking lots, and rental car facilities. Based on the results of the general survey, focused surveys were considered unnecessary.

Special-Status Species

Based on habitat suitability and CNDDB search results of all surrounding quadrangle maps, no special-status species, as described in the following subsections, have a moderate or high potential to occur in the Proposed Project footprint.

Sensitive Plants

Special-status plant species include those species listed by the USFWS and CDFW as endangered, threatened, proposed, or candidate species, and those listed as sensitive or rare. In addition, sensitive plant species include those occurring on the CNPS Inventory of Rare and Endangered Vascular Plants of California.

A total of 14 special-status plant species were originally identified as having potential to occur within the Proposed Project site; however, because the Proposed Project site is mostly developed and much of the area is paved, no special-status plant species are expected to occur within the Proposed Project footprint. Therefore, all special-status plant species that were identified during the literature review were determined to have no potential to occur within the Proposed Project footprint.

Sensitive Wildlife Species

Special-status wildlife species include those species listed by the USFWS or CDFW as endangered, threatened, proposed; those listed by the CDFW as Fully Protected or Species of Special Concern (SSC); and those listed as regionally sensitive in SDG&E's NCCP. The special-status wildlife species with potential to occur in the Proposed Project footprint include the following:

- American peregrine falcon (*Falco peregrinus anatum*) is a California fully protected species and has low potential to occur because some marginal nesting habitat in the form of tall buildings and bridges is present in the vicinity of the Proposed Project site.

- Mexican long-tongued bat (*Choeronycteris mexicana*) is an SSC and has a low potential to occur because some marginal habitat in the form of overpasses and buildings is present in the vicinity of the Proposed Project site.

No suitable habitat for other special-status wildlife species is present within the Proposed Project footprint; however, special-status avian species (e.g., western snowy plover [*Charadrius alexandrines nivosus*] and California least tern [*Sternula antillarum browni*]) may fly through the Proposed Project site to reach more suitable habitat in the San Diego Bay or inland areas.

Critical Habitat

Under the FESA, to the extent prudent and determinable, the USFWS is required to designate critical habitat for endangered and threatened species (16 U.S.C. § 1533 (a)(3)). Critical habitat is defined as areas of land, water, and air space containing the physical and biological features essential for the survival and recovery of endangered and threatened species. Designated critical habitat includes sites for breeding and rearing, movement or migration, feeding, roosting, cover, and shelter.

Designated critical habitats require special management and protection of existing resources, including water quality and quantity, host animals and plants, food availability, pollinators, sunlight, and specific soil types. A critical habitat designation delineates all suitable habitat, occupied or not, essential to the survival and recovery of the species.

There are no USFWS-designated critical habitats located in the Proposed Project footprint or within one mile of the Proposed Project footprint. Critical habitat for western snowy plover does not occur within the Proposed Project footprint, but exists approximately three miles southwest of the Proposed Project on Coronado Island.

Wildlife Migration Corridors

Wildlife corridors are defined as areas that connect suitable habitat in a region otherwise fragmented by rugged terrain, changes in vegetation, or human disturbance. Natural features—such as canyon drainages, ridgelines, or areas with vegetation cover—provide corridors for wildlife travel. Wildlife corridors are important because they provide access to mates, food, and water; allow the dispersal of individuals away from high population density areas; and facilitate the exchange of genetics between populations. Wildlife corridors are considered sensitive by resource and conservation agencies.

No major migration corridors traverse the Proposed Project, largely due to its location within a highly urbanized area and adjacent to several roadways carrying high volumes of traffic. As such, the Proposed Project site does not represent an important corridor for wildlife movement, and development of the Proposed Project will not interfere with wildlife movement.

The Pacific Flyway is located just south of the Proposed Project within the San Diego Bay; therefore, some avian species may pass through the Proposed Project site to reach the San Diego Bay. The Pacific Flyway is one of the six major north-south migration routes for waterfowl in the U.S., Mexico, and Canada. The Pacific Flyway links breeding grounds in the north to more southerly wintering areas and is, therefore, utilized by an abundance of bird species during migration. As part of the Pacific Flyway, the San Diego Bay waterbodies provide high-quality rest and forage areas for numerous birds during the migratory seasons.

Terrestrial wildlife species tend to travel along natural drainages that provide protective cover from predators and a foraging source. There are no natural drainage features within the Proposed Project footprint. Furthermore, development occurs throughout the area; therefore, the quality of the site as a wildlife movement corridor for terrestrial species is diminished.

Preserve Areas

A preserve area is a protected area of importance for wildlife, flora, or other special interest. A preserve area is reserved and managed for conservation and to provide special opportunities for study or research. There are no preserve areas in the Proposed Project footprint.

Wetlands and Jurisdictional Waters

As described in Attachment 4.4-B: Biological Survey Memo, a small concrete-lined drainage channel is located on the west side of the proposed Vine Substation site. The channel is an approximately 12-inch wide concrete v-ditch that was designed for storm water conveyance.

There was no vegetation or accumulated sediment observed within the channel. The channel is Municipal Separate Stormwater Sewer System (MS4) and is also referred to in Section 4.9 Hydrology and Water Quality. Wetlands or jurisdictional waters as defined by Section 404 of the Clean Water Act are not present within the Proposed Project footprint.

4.4.3 Impacts

The following discussion describes the Proposed Project's potential to impact sensitive species and habitat that may occur as a result of construction and operation of the Proposed Project. SDG&E will be operating under its own NCCP, which was established according to the FESA and CESA and the state's NCCP Act. With the implementation of SDG&E's NCCP, which is included as an ordinary construction/operating restriction in Chapter 3 – Project Description, potential impacts will be minimized, ensuring the protection and conservation of listed and covered species and their habitats.

Significance Criteria

Standards of impact significance were derived from Appendix G of the CEQA Guidelines. Under these guidelines, impacts to biological resources would be considered significant if the Proposed Project:

- Has a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the USFWS or CDFW

- Has a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the USFWS or CDFW

- Has a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, or other wetland areas) through direct removal, filling, hydrological interruption, or other means

- Interferes substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedes the use of native wildlife nursery sites

- Conflicts with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance

- Conflicts with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state HCP

Direct take of a federally or state-listed species will be considered a significant impact. Temporary and/or permanent habitat loss is not considered a significant impact to sensitive species (other than for listed or candidate species under the FESA and CESA) unless a significant percentage of total suitable habitat throughout the species' range is degraded or

somehow made unsuitable, or areas supporting a large proportion of the species' population are substantially and adversely impacted.

Potential impacts to nesting bird species will be considered significant due to their protection under the MBTA, and such impacts will need to be avoided.

Question 4.4a – Sensitive Species

Construction – Less-than-Significant Impact

Sensitive Plant Species

No sensitive plant species or suitable habitat for sensitive plant species were observed during the reconnaissance-level survey on January 2. In addition, no sensitive plant species were identified during the literature review with potential to occur within the Proposed Project footprint; therefore, no impacts to sensitive plant species are anticipated during construction of the Proposed Project.

Sensitive Invertebrate Species

No sensitive invertebrate species were identified during the literature review as having potential to occur within the Proposed Project site. In addition, no suitable habitat for sensitive invertebrate species is present in the Proposed Project footprint. As such, no impacts to sensitive invertebrate species are anticipated during construction of the Proposed Project.

Sensitive Reptile Species

No sensitive reptile species were identified during the literature review as having potential to occur within Proposed Project site and no sensitive reptile species were observed during the reconnaissance-level survey on January 2. In addition, no suitable habitat for sensitive reptile species is present in the Proposed Project footprint. As such, no impacts to sensitive reptile species are anticipated during construction of the Proposed Project.

Sensitive Avian and Other Nesting Avian Species

No sensitive avian species were identified to have a moderate or high potential to occur in the Proposed Project footprint; however, some common avian species may nest within or in the vicinity of the Proposed Project footprint. Impacts to nesting bird species may include the removal of potential nesting habitat (e.g., ornamental vegetation, including six Mexican fan palms) and the disruption of nesting behavior due to a temporary increase in noise from construction equipment and vehicles. However, the Proposed Project is located in an industrial area near numerous major roadways (including I-5 and Pacific Coast Highway), Amtrak, the North County Transit District Coaster and San Diego Metropolitan Transit System Trolley railroad tracks, and the San Diego International Airport; therefore, impacts from construction noise are not anticipated to be substantial. SDG&E will utilize NCCP protocols, as applicable and described in Attachment 4.4-C: SDG&E NCCP and Operational Protocols. These protocols include, but are not limited to, avoiding wildlife to the extent practicable and conducting pre-construction surveys. Implementation of SDG&E's NCCP will reduce the impacts to nesting avian species to a less-than-significant level.

Sensitive Mammal Species

No mammal species were identified to have a moderate or high potential to occur within the Proposed Project site. In addition, no suitable habitat for sensitive mammal species is present in the Proposed Project footprint. As such, no impacts to sensitive mammal species are anticipated during construction of the Proposed Project.

Critical Habitat

There is no USFWS-designated critical habitat located in or within one mile of the Proposed Project footprint. Consequently, all ground-disturbing activities associated with construction of the Proposed Project will occur outside of critical habitat for sensitive wildlife species; therefore, no impacts to critical habitat for sensitive wildlife species will occur.

Preserve Areas

The Proposed Project falls within the boundaries of the City of San Diego MSCP Subarea Plan; however, the Proposed Project is located outside land designated as a preserve. As such, no impacts to preserves will occur.

Common Species

Common plant and wildlife species have the potential to be impacted by construction of the Proposed Project. Direct impacts to wildlife may include mortality from vehicle collisions, vegetation removal, or possible entrapment. Disturbance to wildlife from construction noise is not anticipated to be substantial because the Proposed Project is located in an industrial area near numerous major roadways (including I-5 and Pacific Coast Highway), the North County Transit District Coaster and San Diego Metropolitan Transit System Trolley tracks, and the San Diego International Airport. The majority of the Proposed Project footprint consists of developed land, and a limited amount of vegetation removal is anticipated. Common wildlife species have the potential to fall into and become trapped within the Proposed Project power line pole excavation areas, as well as trenches. In addition, wildlife has the potential to fall into and become trapped within the oil spill containment basins at the proposed Vine Substation. SDG&E will implement existing NCCP protocols, as applicable and described in Attachment 4.4-C: SDG&E NCCP and Operational Protocols. These protocols include, but are not limited to, training, pre-construction surveys, monitoring during clearing and grading activities, requiring all trenches and excavations to be inspected for wildlife entrapment, and requiring ramping in open excavations. Therefore, impacts to common wildlife species will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Concerns regarding potential electrocution and collision impacts from power lines to wildlife species are primarily focused on avian species. Electrocution with avian species can occur from wing contact as avian species perch, land, or take off from a utility pole by contact with two conductors to complete the electrical circuit, simultaneous contact with energized phase conductors and other equipment, and simultaneous contact with energized wire and a grounded wire. Electrocution of avian species is a greater potential hazard to larger birds, such as raptors, because their body size and wing span are large enough to span the distance between the

conductor wires and, thus, complete the electrical circuit. Collision impacts typically occur to migratory bird species and are generally due to poor visibility of electrical lines.

The power line component of the Proposed Project will consist of looping in an existing 69 kV power line. The 69 kV loop-in will involve removing two existing wood poles; installing two new, self-supported tubular steel poles (TSPs); and replacing an existing wood distribution pole with a new, self-supported TSP. No additional electrocution impacts are anticipated from the power line component of Proposed Project because it will not differ substantially from the existing overhead power line in place. As described in Chapter 3 – Project Description, the power line structures will be constructed in compliance with the Avian Power Line Interaction Committee's (APLIC's) Suggested Practices for Avian Protection on Power Lines. In addition, the 12 kV distribution relocation component of the Proposed Project will utilize a combination of existing and new underground distribution conduit, which will not increase the possibility of avian electrocution within the Proposed Project site. Therefore, the potential impacts of increased wildlife electrocution and collision are anticipated to be less than significant.

Standard operation and maintenance activities—such as structure installation, replacement, and repairs—may potentially impact sensitive species if they are present in the Proposed Project site. Impacts may include the disruption of nesting behavior and direct mortality from maintenance vehicles and equipment. Operation and maintenance work for the Proposed Project will primarily occur within the Proposed Project's fence lines and existing ROW. Because there are numerous major roadways, as well as coaster and trolley tracks present in the area, there will be only a minor increase in vehicle trips and activities; therefore, it is not anticipated that operation and maintenance activities will increase the potential to impact sensitive species and/or sensitive species' habitat. In addition, SDG&E will utilize its existing NCCP during all routine operation and maintenance activities for the Proposed Project. Thus, potential operation and maintenance impacts will be less than significant.

Question 4.4b – Sensitive Natural Communities – *No Impact*

Sensitive vegetation communities include riparian habitat or other sensitive natural communities identified in local or regional plans, policies, or regulations, or designated by the USFWS and the CDFW. No sensitive natural communities—as defined by the USACE, RWQCB, CDFW, and/or the City of San Diego—exist in the Proposed Project footprint. Therefore, there will be no impact to sensitive natural communities.

Question 4.4c – Effects on Jurisdictional Waters – *No Impact*

The Proposed Project footprint does not contain any wetlands or other jurisdictional waters as defined by Section 404 of the Clean Water Act. In addition, with the implementation of the NCCP as described Chapter 3 – Project Description, the Proposed Project's Storm Water Pollution Prevention Plan (SWPPP) and Spill Prevention, Control, and Countermeasure (SPCC) Plan—which are both required by law—as well as SDG&E's Water Quality Construction Best Management Practices (BMP) Manual, indirect impacts to jurisdictional waters resulting from the construction, operation, and maintenance of the Proposed Project will also be avoided.

Question 4.4d – Interfere with Native Wildlife Movement – *Less-than-Significant Impact*

The construction of the Proposed Project will not interfere with the movement of any native wildlife species or interfere with known migration corridors. The Proposed Project is located within a highly urbanized area and adjacent to several roadways carrying high volumes of traffic, as well as coaster and trolley tracks which are movement barriers for some wildlife species (e.g., amphibians and mammals). No known migration corridors and no waterways that contain fish are in the Proposed Project footprint. While vehicle traffic associated with Proposed Project construction or operation may result in species injury or mortality, impacts will be less than significant due to the low likelihood of these collisions occurring and the fact that the potential for this to occur already exists in the Proposed Project footprint due to the existing network of roads and high vehicle use.

The Pacific Flyway is located south of the Proposed Project within the San Diego Bay; therefore, some avian species may traverse through the Proposed Project to reach the San Diego Bay. However, no waterbodies are located within the Proposed Project footprint, which could provide high-quality rest or foraging habitat for avian species during their migration. Avian species that use the Pacific Flyway for migration are more likely to use the waterbodies located outside the Proposed Project footprint for rest and foraging habitat.

Terrestrial wildlife species tend to travel along natural drainages that provide protective cover from predators and a foraging source. There are no natural drainage features within the Proposed Project footprint. Furthermore, development occurs throughout the area; as a result, the quality of the site as a wildlife movement corridor for terrestrial species is diminished. Therefore, potential impacts to terrestrial wildlife movement will be less than significant.

Question 4.4e – Conflict with Local Policies – *No Impact*

Construction, operation, and maintenance of the Proposed Project will not conflict with any local environmental policies or ordinances promulgated to protect biological resources. The following section addresses policies detailed in the Conservation Element of the City of San Diego General Plan that may be applicable to the Proposed Project.

Urban Runoff Management

- *Goal: Protection and restoration of water bodies, including reservoirs, coastal waters, creeks, bays, and wetlands.*

- *Policy CE-E.2. Apply water quality protection measures to land development projects early in the process-during project design, permitting, construction, and operations in order to minimize the quantity of runoff generated onsite, the disruption of natural water flows and the contamination of storm water runoff.*

- *Policy CE-E.6. Continue to encourage "Pollution Control" measures to promote the proper collection and disposal of pollutants at the source, rather than allowing them to enter the storm drain system.*

The Proposed Project will not significantly alter the existing on site drainage patterns or significantly increase the amount of runoff generated from the site. The proposed Vine

Substation is within a paved parking lot and the other Proposed Project components are located within existing paved roads. Therefore, storm water flow patterns are not expected to change substantially from pre-construction conditions. All areas temporarily disturbed during grading will be restored to their original contours, and the surrounding area will be repaired, as appropriate. In addition, landscaping will be installed consistent with SDG&E's Landscape Plan, which is described further in Section 4.1 Aesthetics. The use of pesticides and herbicides will be limited to the minimum necessary to properly maintain on-site landscaping and ensure its long-term survival.

In addition, SDG&E will implement the Proposed Project's SWPPP and SPCC Plan, which are both required by law, as well as SDG&E's Water Quality Construction BMP Manual. As such, potential short-term impacts will be minimized through compliance with applicable Federal, State, and local laws, and proper implementation of SDG&E's Water Quality Construction BMP Manual. In doing so, potential impacts relative to drainage and water quality will be avoided or minimized and will remain to less than significant. For these reasons, the Proposed Project will be consistent with the previously noted goal and policies.

Biological Diversity

- *Goal: Preservation of healthy, biologically diverse, regional ecosystems and conservation of endangered, threatened, and key sensitive species and their habitats.*

No sensitive plant or wildlife species are anticipated to occur within the Proposed Project footprint. In addition, no sensitive natural communities—as defined by the USACE, RWQCB, CDFW, and/or the City of San Diego—exist in the Proposed Project footprint. As such, the Proposed Project will not impact any native vegetation communities or sensitive species and will be consistent with this goal of preserving regional ecosystems and conserving endangered, threatened, and key sensitive species and their habitats.

No other local ordinances protecting biological resources have been identified. Therefore, the Proposed Project will be consistent with local ordinances protecting biological resources and no impact will occur.

Question 4.4f – Conflict with Conservation Plan – *No Impact*

SDG&E's existing NCCP and the City of San Diego MSCP Subarea Plan are the only conservation plans that may apply to the Proposed Project site. SDG&E will operate under its existing NCCP, which was established according to the FESA and CESA and the state's NCCP Act. The NCCP addresses potential impacts to sensitive resources associated with SDG&E's ongoing installation, use, maintenance, and repair of its gas and electric systems, as well as typical expansions of those systems throughout SDG&E's existing service area. The NCCP was developed in coordination with the USFWS and the CDFW, and is designed to be consistent with local HCPs and the overall preserve planning effort, including the City of San Diego MSCP Subarea Plan. The NCCP protocols will be applied to the Proposed Project, as appropriate, to avoid and/or minimize potential impacts resulting from construction of the Proposed Project. Therefore, the Proposed Project will not conflict with any applicable conservation plan, and no impacts will occur.

4.4.4 Applicant-Proposed Measures

With implementation of SDG&E's ordinary construction/operating restrictions, potential impacts related to biological resources, will remain less than significant. As a result, no applicant-proposed measures have been proposed.

URL: www.fws.gov/carlsbad/

Consultation Tracking Number: 08ECAR00-2014-SLI-0106 January 03, 2014
Project Name: Development Project

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project.

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, and proposed species, designated critical habitat, and candidate species that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having

similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species List

There are a total of 14 threatened, endangered, or candidate species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed on the **Has Critical Habitat** lines may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

California Least tern *(Sterna antillarum browni)*
Listing Status: Endangered

California Orcutt grass *(Orcuttia californica)*
Listing Status: Endangered

Coastal California gnatcatcher *(Polioptila californica californica)*
Population: Entire
Listing Status: Threatened
Has Critical Habitat: Final designated, Proposed

Least Bell's vireo *(Vireo bellii pusillus)*
Population: Entire
Listing Status: Endangered
Has Critical Habitat: Final designated

Light-Footed Clapper rail *(Rallus longirostris levipes)*
Population: U.S.A. only
Listing Status: Endangered

Mexican flannelbush *(Fremontodendron mexicanum)*
Listing Status: Endangered
Has Critical Habitat: Final designated

Orcutt's spineflower *(Chorizanthe orcuttiana)*
Listing Status: Endangered

Otay tarplant *(Deinandra (=hemizonia) conjugens)*
Listing Status: Threatened
Has Critical Habitat: Final designated

Pacific Pocket mouse *(Perognathus longimembris pacificus)*
Population: Entire
Listing Status: Endangered

Salt Marsh bird's-beak *(Cordylanthus maritimus ssp. maritimus)*
Listing Status: Endangered

San Diego ambrosia *(Ambrosia pumila)*
Listing Status: Endangered
Has Critical Habitat: Final designated

San Diego button-celery *(Eryngium aristulatum var. parishii)*
Listing Status: Endangered

San Diego fairy shrimp *(Branchinecta sandiegonensis)*
Listing Status: Endangered
Has Critical Habitat: Final designated

western snowy plover *(Charadrius nivosus ssp. nivosus)*
Population: Pacific coastal pop.
Listing Status: Threatened
Has Critical Habitat: Final designated

Critical habitats that lie within your project area

There are no critical habitats within your project area.

ATTACHMENT 4.4-B: BIOLOGICAL SURVEY MEMO

MEMO

Date: April 18, 2014

Re: Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) Reconnaissance-Level Survey

---

Introduction: On January 2, 2014, Insignia biologist Jeffry Coward conducted a reconnaissance-level biological and hydrological survey of the Proposed Project site. The Proposed Project site is comprised of all areas that will be impacted by the Proposed Project (Proposed Project footprint), including:

- The proposed Vine Substation site
- Areas along Kettner Boulevard and Pacific Highway where new and relocated 12 kV distribution circuits and telecommunication facilities will be installed
- Areas adjacent to Kettner Boulevard where the 69 kV loop-in will be constructed

Due to limited access, the western side of the parking lot between the existing fence and the railroad tracks was visually surveyed through a locked chain-link gate. The biologist also surveyed the area surrounding the Proposed Project footprint (Proposed Project site), including the Interstate 5 overpass at Vine Street directly west of the proposed Vine Substation and the Pacific Highway overpass at Sassafras Street. Figure 1: Survey Overview Map depicts the Proposed Project components and the survey area.

Methodology: The biologist conducted a pedestrian survey and documented the dominant plant communities and potential for wildlife species habitat within the Proposed Project site. He also documented plant and animal species observed directly or detected from calls, tracks, scat, nests, or other signs. The wildlife survey was performed during the day; therefore, nocturnal animals were identified by evidence that was apparent at the time of the survey. The potential for sensitive plant and animal species, determined by the presence of diagnostic habitat elements, was documented.

A field investigation for hydrological features within the Proposed Project footprint was also conducted to identify any jurisdictional waters regulated under the federal Clean Water Act (CWA), California Porter-Cologne Water Quality Control Act, and California Fish and Game Code Sections 1600 through 1606. Prior to conducting the site visit, aerial photographs and United States (U.S.) Geological Survey topographic maps of the site were examined. The presence of any jurisdictional areas or drainage channels was noted during the visit. The area was also examined for the presence of potential waters of the U.S.

Survey Results:

Biological Resources

The entire proposed Vine Substation site is an active parking lot surrounded by a chain-link fence. The southern fence is covered with non-native English ivy (*Hedera helix*), which provides a visual barrier between the parking lot and the adjacent rental car facility. No trees were observed along the southern side of the parking lot. The eastern and northern sides of the parking lot have no plants growing near or within the chain-link fence. There are six non-native Mexican fan palm trees (*Washingtonia robusta*) located along the eastern side of the parking lot (Photograph 1). There are no trees along the northern side of the parking lot. The western side of the parking lot contains a dense collection of ornamental and non-native plant species on the outside of the fence line, including Mexican fan palm, pepper tree (*Schinus* sp.) and horseweed (*Conyza bonariensis*) (Photographs 2 and 3).

A small strip of dirt, approximately three feet wide, runs along the entire perimeter of the parking lot, adjacent to the pavement of the parking lot. This strip of dirt is sparsely vegetated with non-native species (Photograph 4). No burrows were observed within this dirt strip.

The interstate and highway overpasses were inspected for potential bird nesting or bat roosting areas. Within each overpass, pre-cast holes were observed within the concrete. The biologist could not determine the depth of these holes; however, no sign of bat or bird use (e.g., white wash, guano, feathers, etc.) was observed. The Port of San Diego building—located near the Pacific Highway overpass at Sassafras Street—was the one structure of sufficient height for potential raptor nests within the survey area (Photograph 5). As shown in Figure 1: Survey Overview Map, the Port of San Diego Building is located approximately 350 feet west of the 12 kV circuits that will be relocated within Kettner Boulevard and approximately 1,100 feet south of the proposed Vine Substation. No sign of any nests or other raptor use of the building was observed. Due to the industrial nature of the area surrounding the building and the numerous major roadways (including Interstate 5 and Pacific Coast Highway), the North County Transit District Coaster and San Diego Metropolitan Transit System Trolley tracks, and the San Diego International Airport, potential nests at this location will not be disturbed by construction. Only one wildlife species was observed during the survey—a rock dove (*Columba livia*)—was observed flying over the parking lot.

The proposed 69 kV loop-in transmission pole sites are located adjacent to a chain-link fence and the railroad tracks. Because the biologist was unable to access these sites, only a portion of the site was surveyed directly; however, the entire site was observed visually. Little to no vegetation was observed directly beneath the transmission line and between the fence and the railroad tracks.

Hydrological Features

The entire Proposed Project footprint was surveyed for the presence of jurisdictional areas, drainage channels, and potential waters of the U.S. The only feature noted was a small (approximately 12-inch-wide and 12-inch-deep) concrete storm water v-ditch located outside the western boundary of the proposed Vine Substation site (Photograph 3). This feature is designed for storm water conveyance and is located in an upland location along the edge of the ornamental vegetation between the railroad tracks and the proposed Vine Substation site. This concrete channel conveys only storm water runoff from the parking lots east of the v-ditch, and the channel flows south to north into a storm drain located on California Street. There was no vegetation or accumulated sediment observed within the channel. The channel is associated with a Municipal Separate Stormwater Sewer System and will be avoided during construction. Wetlands or jurisdictional waters—as defined by Section 404 of the CWA, or under the jurisdiction of the California Department of Fish and Wildlife or the Regional Water Quality Control Board—are not present within the Proposed Project footprint.

Photographs (see Figure 1: Survey Overview Map for the location of each photograph):

Photograph 1: View of the proposed Vine Substation site facing southwest from Vine Street.

Photograph 2: View of ornamental vegetation located adjacent to the proposed Vine Substation site looking south.

Photograph 3: Ornamental vegetation and a concrete channel located between the proposed Vine Substation site and railroad tracks looking south.

Photograph 4: Non-native annual weeds located within the dirt strip along the existing paved parking lot.

Photograph 5: View of the Port of San Diego building facing south. The Port of San Diego building is located approximately 350 feet west of the 12 kV distribution relocation and approximately 1,100 feet south of the proposed Vine Substation.

ATTACHMENT 4.4-C: SDG&E NCCP AND OPERATIONAL PROTOCOLS

7.1 Operational Protocols

Operational protocols represent an environmentally sensitive approach to traditional utility construction, maintenance and repair Activities recognizing that slight adjustments in construction techniques can yield major benefits for the environment. The appropriate Operational Protocols for each individual project will be determined and documented by the Environmental Surveyor. The information regarding the qualifications and responsibilities of the environmental surveyor is contained in Appendix B. The following mitigation measures shall be adhered to by SDG&E.

7.1.1 General Behavior for All Field Personnel

1. Vehicles must be kept on access roads. A 15 mile-per-hour speed limit shall be observed on dirt access roads to allow reptile species to disperse. Vehicles must be turned around in established or designated areas only.

2. No wildlife, including rattlesnakes, may be harmed, except to protect life and limb.

3. Firearms shall be prohibited on the rights-of-way except for those used by security personnel.

4. Feeding of wildlife is not allowed.

5. SDG&E personnel are not allowed to bring pets on the rights-of-way in order to minimize harassment or killing of wildlife and to prevent the introduction of destructive domestic animal diseases to native wildlife populations.

6. Parking or driving underneath oak trees is not allowed in order to protect root structures except in established traffic areas.

Copyright © 1995 San Diego Gas & Electric Company
All rights reserved.

7. Plant or wildlife species may not be collected for pets or any other reason.

8. Littering is not allowed. SDG&E shall not deposit or leave any food or waste on the rights-of-way or adjacent property.

9. Wild Fires shall be prevented or minimized by exercising care when driving and by not parking vehicles where catalytic converters can ignite dry vegetation. In times of high fire hazard, it may be necessary for trucks to carry water and shovels, or fire extinguishers in the field. The use of shields, protective mats, or other fire prevention methods shall be used during grinding and welding to prevent or minimize the potential for fire. Care should be exhibited when smoking in natural habitats.

10. Field crews shall refer environmental issues including wildlife relocation, dead or sick wildlife, hazardous waste, or questions about avoiding environmental impacts to the Environmental Surveyor. Biologists or experts in wildlife handling may need to be brought in by Environmental Surveyor for assistance with wildlife relocations.

7.1.2 Training

11. All SDG&E personnel working within the project area shall participate in an employee training program conducted by SDG&E, with annual updates. The program will consist of a brief discussion of endangered species biology and the legal protections afforded to Covered Species; a discussion of the biology of the Covered Species protected under this Subregional Plan; the habitat requirements of these Covered Species; their status under the Endangered Species Acts; measures being taken for the protection of Covered Species and their habitats under this Subregional Plan; and a review of the Operational Protocols. A fact sheet conveying this information will also be distributed to all employees working in the project area.

12. Designated SDG&E staff will conduct selected reviews of SDG&E operations. Any proposed modifications to Operational Protocols, procedures or conditions will be promptly provided to CDFG and USFWS for their review and input for required permit or Subregional Plan amendments.

7.1.3 Preactivity Studies

13. The Environmental Surveyor shall conduct preactivity studies for all activities occurring off of access roads in natural areas. The scope of these studies is included in Appendix A. The Environmental Surveyor will complete a preactivity study form contained in Appendix A, including recommendations for review by a biologist and construction monitoring as appropriate. Biologists should be called in when there is the potential for unavoidable impacts to Covered Species. The forms are for information only, and will not require CDFG or USFWS approval. These forms shall be faxed to CDFG and USFWS, along with phone notification, who will reply within 5 working days, indicating if they would like to review the project and/or suggest recommendations for post project monitoring. If a biologist is required, he/she will be contacted concurrent to notification to CDFG and USFWS. SDG&E's project may proceed during this time if necessary, in compliance with the recommendations of the biologist (For narrow endemic species see mitigation IV following Table 3.1). USFWS survey protocols performed by qualified biologists will be required for new projects which are defined as projects requiring CEQA review.

In those situations where the Environmental Surveyor cannot make a definitive species

Copyright © 1995 San Diego Gas & Electric Company
All rights reserved.

identification, an on-call biologist will be brought in. When the biologist is called, he or she will be contacted concurrently with CDFG and USFWS. The biologist will make the determination of the species in question and recommend avoidance or mitigation approaches to the Environmental Surveyor and a decision will be made. In those situations where more than one visit may be necessary to identify a given species, such as certain birds, no more than three site visits shall be required. It is expected that the typical USFWS search protocols will not be utilized in most situations due to the Plan's avoidance priority. Background information necessary to complete the annual report shall be collected on the preactivity study form and used by SDG&E to prepare the annual report.

14. In order to ensure that habitats are not inadvertently impacted, the Environmental Surveyor shall determine the extent of habitat and flag boundaries of habitats which must be avoided. When necessary, the Environmental Surveyor should also demark appropriate equipment laydown areas, vehicle turn around areas, and pads for placement of large construction equipment such as cranes, bucket trucks, augers, etc. When appropriate, the Environmental Surveyor shall make office and/or field presentations to field staff to review and become familiar with natural resources to be protected on a project specific basis.

15. SDG&E will maintain a library of rare plant locations known to SDG&E occurring within easements and fee owned properties. "Known" means a verified population, either extant or documented using record data. Information on known sites may come from a variety of record data sources including local agency Habitat Conservation Plans, pre-activity surveys, or biological surveys conducted for environmental compliance on a project site (e.g. initial study), but there is no requirement for development of original biological data. Plant inventories shall be consulted as part of pre-activity survey procedures.

7.1.4 Maintenance, Repair and Construction of Facilities

16. Maintenance, repair and construction Activities shall be designed and implemented to minimize new disturbance, erosion on manufactured and other slopes, and off-site degradation from accelerated sedimentation, and to reduce maintenance and repair costs.

17. Routine maintenance of all Facilities includes visual inspections on a regular basis, conducted from vehicles driven on the access roads where possible. If it is necessary to inspect areas which cannot be seen from the roads, the inspection shall be done on foot, or from the air.

18. When the view of a gas transmission line marker becomes obscured by vegetation on a regular basis requiring repeated habitat removal, consideration shall be given to the replacement of markers with taller versions.

19. Erosion will be minimized on access roads and other locations primarily with water bars. The water bars are mounds of soil shaped to direct flow and prevent erosion.

20. Hydrologic impacts will be minimized through the use of state-of-the-art technical design and construction techniques to minimize ponding, eliminate flood hazards, and avoid erosion and siltation into any creeks, streams, rivers, or bodies of water by use of Best Management Practices.

Copyright © 1995 San Diego Gas & Electric Company
All rights reserved.

21. When siting new facilities, every effort will be made to cross the wetland habitat perpendicular to the watercourse, spanning the watercourse to minimize the amount of disturbance to riparian areas (See Figure 4).

22. Gas and other facilities cross streambeds and require maintenance and repair. During such times water may be temporarily diverted as long as after disturbance natural drainage patterns are restored to minimize the impact of the disturbance and help to reestablish or enhance the native habitat. Erosion control during construction in the form of intermittent check dams and culverts should also be considered to prevent alteration to natural drainage patterns and prevent siltation.

23. Impacts to wetlands shall be minimized by avoiding pushing soil or brush into washes or ravines.

24. During work on facilities, all trucks, tools, and equipment should be kept on existing access roads or cleared areas, to the extent possible.

25. Environmental Surveyor must approve of activity prior to working in sensitive areas where disturbance to habitat may be unavoidable.

26. Insulator washing is allowed from access roads if other applicable protocols are followed.

27. Brush clearing around facilities for fire protection shall not be conducted from March through August without prior approval by the Environmental Surveyor. The Environmental Surveyor will make sure that the habitat contains no active nests, burrows, or dens prior to clearing.

28. In the event SDG&E identifies a covered species of plant within a 10' radius around power poles, which is the area required to be cleared for fire protection purposes, SDG&E shall notify USFWS (for ESA listed plants), and CDFG (for CESA listed plants), in writing, of the plant's identity and location and of the proposed Activity, which will result in a Take of such plant. Notification will occur ten (10) working days prior to such Activity, during which time USFWS or CDFG may remove such plant(s). If neither USFWS or CDFG have removed such plant(s) within the ten (10) working days following the notice, SDG&E may proceed to complete its fire clearing and cause a Take of such plant(s).

    When fire clearing is necessary in instances other than around power poles, and the potential for impacts to Covered Species exists, SDG&E will follow the preactivity study and notification procedures in Operational Protocol number 13.

29. Wire stringing is allowed year round in sensitive habitats if conductor is not allowed to drag on ground or in brush and vehicles remain on access roads.

30. Maintenance of cut and fill slopes shall consist primarily of erosion repair. In situations where revegetation would improve the success of erosion control, planting or seeding with native hydroseed mix may be done on slopes.

31. Spoils created during maintenance operations shall be disposed of only on previously disturbed areas designated by the Environmental Surveyor or used immediately to fill eroded areas. Cleared vegetation shall be hauled off the rights-of-way to a permitted disposal location.

Copyright © 1995 San Diego Gas & Electric Company
All rights reserved.

32. Within 6 months of Plan approval, environmentally sensitive tree trimming locations will be identified in the tree trim computer data base system utilized by tree trim contractors. (This data base also tracks the date of each tree trim, type of tree, where threatening dogs reside, etc.). The Environmental Surveyor should be contacted to perform a preactivity survey when trimming is planned in environmentally sensitive areas. Whenever possible, trees in environmentally sensitive areas (determined by CDFG and SDG&E) will be scheduled for trimming in the non-sensitive times.

33. No new Facilities and Activities shall be planned which disturb vernal pools, their watersheds, or impact their natural regeneration. Continued historic maintenance of existing infrastructure utilizing existing access roads is allowed to continue in areas containing vernal pool habitat. New construction of overhead infrastructure which spans vernal pool habitats is allowed as long as the placement of facilities or the associated construction activities in no way impact the vernal pools.

34. If any previously unidentified dens, burrows, or plants are located on any project site after the preactivity survey, the Environmental Surveyor shall be contacted. Environmental Surveyor will determine how to best avoid or minimize impacting the resource by considering such methods as project or work plan redevelopment, equipment placement or construction method modification, seasonal/time of day limitations, etc...

35. The Environmental Surveyor shall conduct monitoring as recommended in the preactivity survey report. At completion of work, the Environmental Surveyor shall check to verify compliance, including observing that flagged areas have been avoided and that reclamation has been properly implemented. Also at completion of work, the Environmental Surveyor is responsible for removing all habitat flagging from the construction site.

36. The Environmental Surveyor shall conduct checks on mowing procedures, to ensure that mowing is limited to a 12-foot wide area on straight portions of the road (slightly wider on radius turns), and that the mowing height is no less than 4 inches.

37. Supplies or equipment where wildlife could hide (e.g., pipes, culverts, pole holes) shall be inspected prior to moving or working on them to reduce the potential for injury to wildlife. Supplies or equipment that cannot be inspected or from which animals could not be removed shall be capped or otherwise covered at the end of each work day. Old piping or other supplies that have been left open, shall not be capped until inspected and any species found in it allowed to escape. Ramping shall be provided in open trenches when necessary. If an animal is found entrapped in supplies or equipment, such as a pipe section, the supplies or equipment shall be avoided and the animal(s) left to leave on its own accord, except as otherwise authorized by CDFG.

38. All steep-walled trenches or excavations used during construction shall be inspected twice daily (early morning and evening) to protect against wildlife entrapment. If wildlife are located in the trench or excavation, the Environmental Surveyor shall be called immediately to remove them if they cannot escape unimpeded.

39. Large amounts of fugitive dust could interfere with photosynthesis. Fugitive dust created during clearing, grading, earth-moving, excavation or other construction activities will be controlled by regular watering. At all times, fugitive dust emissions will be controlled by limiting on-site vehicle speed to 15 miles per hour.

All rights reserved.

40. Before using pesticides in areas where burrowing owls may be found, a pre-activity survey will be conducted.

7.1.5 Maintenance of access roads shall consist of:

41. Repair of erosion by grading, addition of fill, and compacting. In each case of repair, the total area of disturbance shall be minimized by careful access and use of appropriately sized equipment. Repairs shall be done after preactivity surveys conducted by the Environmental Surveyor and in accordance with the recommendations regarding construction monitoring and relevant protocols. Consideration should be given to source of erosion problem, when source is within control of SDG&E.

42. Vegetation control through grading should be used only where the vegetation obscures the inspection of facilities, access may be entirely lost, or the threat of Facility failure or fire hazard exists. The graded access road area should not exceed 12'-wide on straight portions (radius turns may be slightly wider) (See Figure 23).

43. Mowing habitat can be an effective method for protecting the vegetative understory while at the same time creating access to a work area. Mowing should be used when permanent access is not required since, with time, total revegetation is expected. If mowing is in response to a permanent access need, but the alternative of grading is undesirable because of downstream siltation potential, it should be recognized that periodic mowing will be necessary to maintain permanent access.

44. Maintenance work on access roads should not expand the existing road bed (See Figure 23).

45. Material for filling in road ruts should never be obtained from the sides of the road which contain habitat without approval from Environmental Surveyor..

7.1.6 Construction of new access roads shall comply with the following:

46. SDG&E access roads will be designed and constructed according to the SDG&E *Guide for Encroachment on Transmission Rights-of-Way (4/91).*

47. Access roads will be made available to managers of the regional preserve system subject to coordination with SDG&E.

48. New access roads shall be designed to be placed in previously disturbed areas and areas which require the least amount of grading in sensitive areas during construction whenever possible (See Figure 5). Preference shall be given to the use of stub roads rather than linking facilities tangentially.

49. SDG&E will consider providing access control on access roads leading into the regional preserve system where such control provides benefit to sensitive resources.

50. New access road construction is allowed year round. Every effort shall be made to avoid constructing roads during the nesting season. During the nesting season, the presence or absence of nesting species shall be determined by a biologist and appropriate avoidance and minimization recommendations followed.

7.1.7 Construction and Maintenance of Access Roads Through Streambeds

51. Construction of new access roads through streambeds requires a Streambed Alteration Agreement from CDFG and/or consultation with the Army Corps of Engineers.

52. Maintenance or construction vehicle access through shallow creeks or streams is allowed. However, no filling for access purposes in waterways is allowed without the installation of appropriately sized culverts. The use of geotextile matting should be considered when it would protect wetland species.

53. Staging/storage areas for equipment and materials shall be located outside of riparian areas. (See Figure 23).

7.1.8 Survey Work

54. Brush clearing for foot paths or line-of-sight cutting is not allowed from March through August in sensitive habitats without prior approval from the Environmental Surveyor, who will ensure that activity does not adversely affect a sensitive species.

55. SDG&E survey personnel must keep vehicles on existing access roads. No clearing of brush for panel point placement is allowed from March through August without prior approval from the Environmental Surveyor.

56. Hiking off roads or paths for survey data collection is allowed year round so long as other protocols are met.

7.1.9 Emergency Repairs

57. During a system emergency, unnecessary carelessness which results in environmental damage is prohibited.

58. Emergency repair of facilities is required in situations which potentially or immediately threaten the integrity of the SDG&E system, such as pipe leaks, or downed lines, slumps, slides, major subsidence, etc. During emergency repairs the Operational Protocols contained in this Subregional Plan shall continued to be followed to fullest extent possible.

59. Once the emergency has stabilized, any unavoidable environmental damage will be reported to the Environmental Surveyor by the foreman. The Environmental Surveyor will develop a mitigation plan and ensure its implementation is consistent with this Subregional Plan.

7.1.10 Activities of Underlying Fee Owners

60. Most SDG&E rights-of-way are held in easement only. The activities of underlying fee owners cannot be controlled by SDG&E and are not covered by this Subregional Plan.

61. When sensitive habitat exists on either side of a utility right-of-way, SDG&E will not oppose underlying fee owners dedicating said property to conservation purposes. Underlying fee owners are expected to comply with applicable federal, state, and local regulations.

4.5 CULTURAL RESOURCES

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?			✓	
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?			✓	
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?			✓	
d) Disturb any human remains, including those interred outside of formal cemeteries?			✓	

4.5.0 Introduction

This section describes the archaeological, historical, and paleontological resources identified within the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and identifies potential impacts that could result from construction, operation, and maintenance of the Proposed Project. The analysis in this section is based on the Cultural Resource Review for the Proposed Project that was prepared by ASM Affiliates, Inc. (ASM) in February 2014 (ASM 2014), as well as a Paleontological Record Search that was completed by the San Diego Natural History Museum's (SDNHM's) Department of PaleoServices in May 2013 (SDNHM 2013).

Cultural resources, as defined under the California Environmental Quality Act (CEQA), include archaeological sites, sacred sites, traditional cultural properties, rock art, rock piles or cairns, historic buildings, and other features of the historic built environment. Cultural resources identified within the Proposed Project site are limited to prehistoric and historic archaeological sites. With the implementation of applicant-proposed measures (APMs), potential impacts to cultural resources that may result from the Proposed Project will be reduced to a less-than-significant level.

There is a moderate to high sensitivity for paleontological resources in the Bay Point geologic formation within the Proposed Project area and in the Lindavista and San Diego geologic formations that are located within 500 feet of the Proposed Project area. These formations will most likely be impacted if the Proposed Project's excavation activities extend below the more recent Bay Point Formation. With the implementation of APMs, potential impacts to paleontological resources that may result from the Proposed Project will be reduced to a less-than-significant level.

4.5.1 Methodology

Cultural Resources

Records Search

Site record and archival searches were completed at the South Coastal Information Center (SCIC) of the California Historic Resources Information System. The records search study area encompassed a one-mile radius around the Proposed Project. Extant historic maps, historic registers, landmark lists, and other documents were consulted. Previously identified cultural resources within the study area were identified in the records search. A Cultural Resource Review was prepared (ASM 2014) for the Proposed Project.

Native American Contacts

The Native American Heritage Commission (NAHC) was contacted for a Sacred Lands Record Search to obtain additional information regarding potential cultural resources within or near the Proposed Project area. The response from the NAHC indicated that no Native American traditional cultural places had been submitted for the Proposed Project area. The NAHC also provided a list of local Native American contacts that may be knowledgeable about cultural resources within or near the Proposed Project area. Letters were sent to these representatives by ASM, and copies of the letters are included in Attachment 4.5-A: NAHC Correspondence. No replies have been received to date.

Cultural Resources Field Survey

As the Proposed Project area is located within previously developed area, a cultural resources field survey was not conducted. A cultural resources summary report was prepared (ASM 2014) for the Proposed Project.

Paleontological Resources

A thorough literature review and records search was conducted of relevant published geologic reports, unpublished paleontological reports, and museum paleontological records of known localities to identify the potential for paleontological resources to exist in the vicinity of the Proposed Project. This approach was utilized due to the direct relationship between paleontological resources and the geologic formations within which they occur. A paleontological resource assessment summary letter was prepared for the Proposed Project (SDNHM 2013).

4.5.2 Existing Conditions

Regulatory Background

The following sections describe federal and state regulations regarding cultural and paleontological resources that apply to the Proposed Project.

Federal

National Historic Preservation Act

The National Historic Preservation Act (NHPA), enacted in 1969, requires federal agencies to consider the effects of their undertakings on historic properties. Historic properties are cultural resources (i.e., archaeological sites, historic built environment features, or Native American sites) that are listed on or determined to be eligible for listing on the National Register of Historic Places (NRHP). The governing regulation, Section 106 of the NHPA—which is codified in Title 36 of the Code of Federal Regulations (CFR) Part 800—requires the project's lead federal agency to consult with the State Historic Preservation Officer regarding potential impacts to historic properties. The goal of the Section 106 process is to offer a measure of protection for cultural resources that are determined eligible or potential eligible for listing on the NRHP. The criteria for determining eligibility can be found in 36 CFR Part 60.

American Indian Religious Freedom Act of 1978

The American Indian Religious Freedom Act establishes a federal policy of respect for, and protection of, Native American religious practices. It also contains provisions that allow limited access to Native American religious sites.

Paleontological Resources Preservation Act

On March 30, 2009, the Paleontological Resources Preservation Act (PRPA), 16 USC 470aaa, became law. This law requires the United States (U.S.) Secretaries of the Interior and Agriculture to manage and protect paleontological resources on federal lands using scientific principles and expertise. New policies from the agencies regarding paleontological resources are now in progress.

State

California Environmental Quality Act

CEQA requires that impacts to cultural resources be identified and, if impacts will be significant, that mitigation measures be implemented to reduce those impacts to the extent feasible. In the protection and management of the cultural environment, both the statute and its CEQA Guidelines provide definitions and standards for cultural resources management. Pursuant to Guideline 15064.5(a), the term "historical resource" includes:

- A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (CRHR).

- A resource included in a local register of historical resources…or identified as significant in a historical resource survey…shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or

cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the CRHR, including the following:

- It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- It is associated with the lives of persons important in our past.
- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- It has yielded, or may be likely to yield, information important in prehistory or history.

- The fact that a resource is not listed in, or determined to be eligible for listing in the CRHR, not included in a local register of historical resources, or identified in a historical resources survey, does not preclude a lead agency from determining that the resource may be a historical resource.

As defined in Section 21083.2(g) of CEQA, a "unique archaeological resource" is:

- An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
  - It contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
  - It has a special and particular quality such as being the oldest of its type or the best available example of its type.
  - It is directly associated with a scientifically recognized important prehistoric or historical event or person.

Section 15064.5(b)(1) of the CEQA Guidelines explains that effects on cultural properties that qualify as historical resources or unique archaeological resources would be considered adverse if they involve physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource would be materially impaired.

The statutes and guidelines cited above specify how cultural resources are to be analyzed for projects subject to CEQA. Archival and field surveys must be conducted, and identified cultural resources must be inventoried and evaluated in prescribed ways.

California Register of Historical Resources

The CRHR is a public listing of specific properties to be "protected from substantial adverse change" that was established by the California Office of Historic Preservation. Any resource eligible for listing in the CRHR must also be considered under the CEQA, described under California Public Resources Code (PRC) Section 21000 et seq., and California Code of Regulations, Title 14, Section 15000 et seq.

A historical resource may be listed in the CRHR if it meets one or more of the following criteria:

- It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the U.S.
- It is associated with the lives of persons important to local, California, or national history.
- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic value.
- It has yielded or has the potential to yield information that is important in the prehistory or history of the local area, California, or the nation.

Automatic listings include properties listed in the NRHP—which are determined to be eligible either by the Keeper of the National Register or through a consensus determination on a project review—or State Historical Landmarks from number 770 onward. In addition, Points of Historical Interest nominated since January 1998 are to be jointly listed as Points of Historical Interest and in the CRHR. Landmarks prior to number 770 and Points of Historical Interest may be listed through an action of the State Historical Resources Commission.

Resources listed in a local historic register or deemed significant in a historical resources survey, as provided under PRC Section 5024.1(g), are presumed to be historically or culturally significant unless the preponderance of evidence demonstrates that they are not. A resource that is not listed on or determined to be ineligible for listing in the CRHR, not included in a local register of historical resources, or not deemed significant in a historical resources survey may, nonetheless, be historically significant (PRC Section 21084.1).

California Native American Graves Protection and Repatriation Act of 2001, California Health and Safety Code

Broad provisions for the protection of Native American cultural resources are contained in the California Health and Safety Code, Division 7, Part 2, Chapter 5 (Sections 8010 through 8030), including the California Native American Graves Protection and Repatriation Act (Cal NAGPRA). Cal NAGPRA established a state policy to ensure that California Native American human remains and cultural items are treated with respect and dignity. The Cal NAGPRA also provides the mechanism for disclosure and return of human remains and cultural items held by publicly funded agencies and museums in California. Likewise, the Cal NAGPRA outlines the process that California Native American tribes who are not recognized by the federal government may follow to file claims for human remains and cultural items held in agencies or museums.

California Public Resources Code

Several provisions of the PRC govern archaeological finds in terms of human remains, or any other related object of archaeological or historical interest or value. Procedures are detailed under PRC Section 5097.9 through 5097.996 for actions to be taken whenever Native American remains are discovered. Under these provisions, if a county coroner determines that human remains found during excavation or disturbance of land are Native American, the coroner must contact the NAHC within 48 hours, and the NAHC must determine and notify the Most Likely Descendant (MLD) who may make recommendations for removal and nondestructive analysis of the remains and for the removal of items associated with Native American burials or cremations. Furthermore, Section 7050.5 of the California Health and Safety Code states that any person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes any human remains in or from any location other than a dedicated cemetery without authority of law is guilty of a misdemeanor, except as provided in PRC Section 5097.99. Any person removing any human remains without authority of law or written permission of the person or persons having the right to control the remains under PRC Section 7100 has committed a public offense that is punishable by imprisonment.

CEQA – Paleontological Resources

Paleontological resources are limited, non-renewable resources of scientific, cultural, and educational value that are protected under CEQA (PRC Section 21000 et seq.). CEQA and PRC Section 5097 et seq. govern the preservation and protection of these resources.

City of San Diego

The City of San Diego regulations and policies pertaining to cultural resources and paleontological resources can be found in Chapters 11, 12, and 14 of the Municipal Code, which establish the Historical Resources Board authority, appointment and terms, meeting conduct, and powers and duties; the designation process including the nomination process, noticing and report requirements, appeals, recordation, amendments or recision, and nomination of historical resources to state and national registers; and development regulations for historical resources. The purpose of these regulations is to protect, preserve, and, where damaged, restore the historical resources of San Diego. The historical resources regulations require that designated historical resources, important archeological sites, and traditional cultural properties be preserved unless deviation findings can be made by the decision-maker as part of a discretionary permit. Minor alterations consistent with the U.S. Secretary of the Interior's Standards are exempt from the requirement to obtain a separate permit, but must comply with the regulations and associated historical resources guidelines. Limited development may encroach into important archaeological sites if adequate mitigation measures are provided as a condition of approval.

The Historical Resources Guidelines, located in the City of San Diego's Land Development Manual, provide property owners, the development community, consultants, and the general public explicit guidance for the management of historical resources located within the City of San Diego's jurisdiction. These guidelines are designed to implement the historical resources regulations and guide the development review process. The guidelines also address the need for a survey and how impacts are to be assessed, available mitigation strategies, and report

requirements. They also include appropriate methodologies for treating historical resources located in the City of San Diego.

Cultural Setting

Prehistoric Background

The earliest well-documented sites in the San Diego area belong to the San Dieguito complex, thought to be over 9,000 years old. Related materials were found in the Mojave Desert and in the Great Basin, sometimes called the Lake Mojave complex. Diagnostic artifact types and categories associated with the San Dieguito complex include scraper planes; choppers; scraping tools; crescentics; elongated bifacial knives; and Silver Lake, Lake Mojave, and leaf-shaped projectile points. In areas adjacent to the coast, many Paleoamerican period sites were probably covered by rising sea levels since the end of the Pleistocene. In more inland regions, alluvial sedimentation in valley areas may cover these materials. Stable mesa landforms in the region, an abundance of appropriate lithic material, and soil column exposures along areas such as the San Diego River make the foothills an important area for Paleoamerican research.

The Archaic period (7,000 to 1,500 years before present [B.P.]) brings an apparent shift toward a more generalized economy and an increased emphasis on seed resources, small game, and shellfish. Local cultural manifestations of the Archaic period are called the La Jollan complex along the coast and the Pauma complex inland. Pauma complex sites lack the shell that dominates many La Jollan complex site assemblages. The La Jollan tool assemblage is dominated by rough, cobble-based choppers and scrapers, as well as slab and basin metates. Recently, there has been considerable debate about whether San Dieguito and La Jollan patterns might represent the same people using different environments and subsistence techniques or whether they are separate cultural patterns.

The Late Prehistoric period (1500 B.P. to 200 B.P.) is characterized by higher population densities and elaborations in social, political, and technological systems. Economic systems diversified and intensified during this period, with continued elaboration of trade networks, use of shell-bead currency, and appearance of more labor-intensive but effective technological innovations.

Subsistence is thought to have focused on acorns and grass seeds, with small game serving as a primary protein resource and big game as a secondary resource. Fish and shellfish were also secondary resources except for areas immediately adjacent to the coast where they assumed primary importance. The settlement system is characterized by seasonal villages where people utilized a central-based collecting subsistence strategy. Artifactual material is characterized by the presence of arrow shaft straighteners, pendants, comales (heating stones), Tizon Brownware pottery, ceramic figurines reminiscent of Hohokam styles, ceramic “Yuman bow pipes,” ceramic rattles, miniature pottery, various cobble-based tools (e.g., scrapers, choppers, hammerstones), bone awls, manos and metates, and mortars and pestles. The arrow point assemblage is dominated by the Desert Side-notched series, but the Cottonwood series and the Dos Cabazas Serrated type also occur.

Ethnographic Setting

The Proposed Project area is in the traditional territory of the Kumeyaay. Also known as Kamia, Ipai, Tipai, and Diegueño, the Kumeyaay occupied the southern two-thirds of San Diego County. The Kumeyaay spoke a language belonging to the Hokan language family, which includes the lower Colorado River tribes and Arizona groups to whom they are closely related. The Kumeyaay lived in semi-sedentary, politically autonomous villages or rancherias. Most rancherias were the seat of a clan, although it is thought that aboriginally some clans had more than one rancheria and some rancherias contained more than one clan.

Historic Setting

Cultural activities within San Diego County between the late 1700s and the present provide a record of Native American, Spanish, Mexican, and American occupation and land use. The Spanish period (1769 to 1821) represents a time of European exploration and settlement. Dual military and religious contingents established the San Diego Presidio and the San Diego Mission. The mission system used Native American labor to build the infrastructure needed for European settlement. By about 1821, the traditional lifeways were disrupted, and Native American populations were tied economically to the missions. In addition to providing new construction methods and architectural styles, the mission system introduced horses, cattle, and other agricultural goods and implements to the area. The cultural systems and institutions established by the Spanish continued to influence the region beyond 1821, when California came under Mexican rule.

The Mexican period (1821 to 1848) retained many of the Spanish institutions and laws; however, in 1834 the mission system was secularized. This allowed for increased Mexican settlement, but it also meant that many Native Americans were dispossessed. After secularization, large tracts of land were granted to individuals and families, and a rancho system was established. Land was used primarily for grazing cattle. Cattle ranching dominated the agricultural activities, and development of hide and tallow trade with the U.S. increased during the early part of this period. Pueblo of San Diego was established at this time and Native American influence greatly declined. The Mexican period ended when Mexico ceded California to the U.S. after the Mexican-American War (1846 to 1848).

Proposed Project Area Historic Background

The first attempt to establish a city on the San Diego Bay occurred in 1850 when William Heath Davis and Andrew B. Gray purchased 160 acres of bayfront property bounded by present-day Broadway, Market Street, First Street, and Pacific Highway. However, due to financial and other constraints, this initial enterprise was unsuccessful. It was not until almost 20 years later that southern California's first true boom resulted in the establishment of the City of San Diego.

San Diego's first boom was due to the energy of Alonzo E. Horton, a San Francisco merchant and former land speculator who came to California to seek his fortune in the gold rush. He established a mercantile business in San Francisco and, in 1867, purchased a tract of approximately 1,000 acres on San Diego Bay surrounding Davis' earlier subdivision. Horton's Addition included present-day downtown San Diego and Hillcrest. He had the parcel surveyed and laid out a park, streets, blocks, and lots on the scrub-covered hills and plains, and initially

gave lots free to anyone that would build a permanent structure. In 1869, people began pouring into San Diego to buy lots from Horton, and it is likely that the Proposed Project area saw much of its initial development in this period. By March 24, 1869, 124 dwellings had been erected. Framed Italianate-style buildings, typical of most urban areas of the west, dominated architecture for the next 15 years. By 1870, San Diego was a community of 2,300 inhabitants. On April 3, 1871, the county courts moved from Old San Diego to Horton's Addition, signifying that San Diego was no longer to be identified as a small pueblo of adobe houses but as a city on the bay.

The Proposed Project area is located outside of the main area of development in the City of San Diego and is not shown in the 1876 bird's eye view maps or available Sanborn fire insurance maps from that time. In 1928, houses existed on the northeast and south sides of the proposed Vine Substation site. This site was an asphalt-paved parking lot since at least 1953 until 1964 when the property was graded for commercial buildings that were constructed by 1972. By 1980, the buildings had been demolished and the property was returned to its prior use as an asphalt-paved parking lot.

Cultural Resources in the Proposed Project Area

The results of the record search indicate that six previously recorded archaeological resources and 17 historic built resources were recorded within 0.25 mile of the Proposed Project area, as provided in Table 4.5-1: Previously Recorded Cultural Resources within a 0.25-Mile Radius of the Proposed Area of Potential Effect and Table 4.5-2: Previously Recorded Sites Built Resources within a 0.25-Mile Radius of the Proposed Area of Potential Effect. A number of the historical structures, as well as the district itself, were recommended eligible for listing in the CRHR; however, they were subsequently demolished to provide additional parking and staging for the San Diego International Airport. No sites were identified in the APE for the Proposed Project.

Table 4.5-1: Previously Recorded Cultural Resources within a 0.25-Mile Radius of the Proposed Area of Potential Effect

Site Number	Description	Eligibility Status
CA-SDI-00053	Prehistoric Habitation	Not evaluated
CA-SDI-00054	Prehistoric Scatter	Not evaluated
CA-SDI-13761	Historic Barth Foundry Dump	Not evaluated

Paleontological Resources in the Proposed Project Area

The Proposed Project site is directly underlain by sedimentary rock that has been mapped by Kennedy (1975) as the Pleistocene-age Bay Point Formation (approximately 220,000 years old). The Pleistocene-age Lindavista Formation (0.5 to 1.5 million years old) and the Pliocene-age San Diego Formation (approximately two to four million years old) are mapped within less than 500 feet of the Proposed Project site, and will most likely be impacted if excavations extend below the Bay Point Formation. The Bay Point and San Diego formations have a high paleontological sensitivity, and the Lindavista Formation has a moderate paleontological sensitivity.

The records search and literature conducted by the SDNHM Department of PaleoServices has identified 85 fossil localities within a one-mile radius of the Proposed Project. All of these localities occur within deposits of the San Diego Formation. These localities produced impressions of plants (e.g., kelp), trace remains of marine invertebrates (e.g., bryozoans, foraminifera, barnacles, branchiopods, shrimp, crabs, urchins, snails, clams, mussels, oysters, scallops, and tusk shells), mineralized bone remains of marine vertebrates (e.g., rays, sharks, fish, seals, walruses, sea cows, dolphins, porpoises, and toothed and baleen whales), and mineralized bone remains of terrestrial vertebrates (e.g., snakes, rabbits, and birds).

4.5.3 Impacts

Significance Criteria

Cultural Resources

Under CEQA, Proposed Project construction, operation, and maintenance effects to unique or important resources must be considered. A resource is unique or important if it meets any of the following criteria:

- It is associated with an event or person of recognized importance in California or American history or scientific importance in prehistory.
- It is associated with the lives of persons important to our past.
- It has or can provide useful information of demonstrable public interest and is useful in addressing scientifically consequential and reasonable archaeological research questions.
- It has a special or particular quality, such as oldest, best example, largest, or last surviving example of its kind.

Construction-related subsurface and surface disturbances could result in a loss of integrity of cultural deposits, a loss of scientific information, and the alteration of an archaeological site setting. Potential indirect impacts—primarily vandalism—can result from increased access and use of the general area during construction and long-term operation and maintenance activities. The potential also exists for the inadvertent discovery of buried or masked archaeological materials during construction activities.

Impacts to cultural resources would be considered significant if the Proposed Project:

- Causes a substantial adverse change in the significance of a historical resource, as defined in Section 15064.5 of the CEQA Guidelines

- Causes a substantial adverse change in the significance of an archaeological resource, pursuant to Section 15064.5 of the CEQA Guidelines
- Disturbs any human remains, including those interred outside of formal cemeteries

"Substantial adverse change" means demolition, destruction, relocation, or alteration such that the significance of a historical resource will be impaired. Section 21084.1 of the CEQA Guidelines stipulates that any resource listed on, or eligible for listing on, the CRHR is presumed to be historically or culturally significant. Section 21084.1 requires treatment of any substantial adverse change in the significance of a historical resource listed on, or eligible to be listed on, the CRHR as a significant effect on the environment.

Paleontological Resources

Impacts to paleontological resources will be considered significant if the Proposed Project directly or indirectly destroys a unique paleontological resource or site or unique geologic feature. Because fossils are the remains of prehistoric animal and plant life, they are considered to be non-renewable. Impacts to paleontological resources are identified from high to zero depending on the resource sensitivity of impacted formations. The specific criteria applied for each sensitivity category are summarized as follows:

- High significance: Impacts to high-sensitivity formations (Bay Point and San Diego formations).
- Moderate significance: Impacts to moderate-sensitivity formations (Lindavista Formation).
- Low significance: Impacts to low-sensitivity formations (none expected within the Proposed Project boundaries).
- Zero significance: Impacts to zero-sensitivity formations (none expected within the Proposed Project boundaries).

Question 4.5a – Historical Resource Change

Construction – Less-than-Significant Impact

Based on archival information, no historical resources are located within the Proposed Project area. Therefore, the Proposed Project will not have an adverse effect on historical resources, and no impacts are anticipated.

Construction of the Proposed Project will involve grading, trenching, and excavation activities, which have the potential to uncover and potentially damage or destroy unknown resources. While the potential to discover buried historical resources is unlikely due to the previous disturbance to the Proposed Project area, SDG&E will implement APM-CUL-01, as described in Section 4.5.4 Applicant-Proposed Measures to minimize potential impacts to unknown historical resources. This APM requires the presence of an archaeological monitor during ground-disturbing activities and allows for the halting of construction activities and contacting SDG&E's Cultural Resource Specialist if a cultural resource is discovered. In addition, SDG&E will implement a Safety and Environmental Awareness Program as part of their ordinary construction restrictions. This program will include training regarding the appropriate work practices necessary to effectively implement the APMs and to comply with the applicable environmental

laws and regulations, including the potential for exposing subsurface cultural resources. Impacts to unknown resources will therefore be reduced to a less-than-significant level.

Operation and Maintenance – No Impact

Typically, operation and maintenance activities associated with the Proposed Project will not require ground disturbance; however, if ground disturbance is required for the repair of Proposed Project components, it will be conducted in areas that were previously disturbed during construction of the Proposed Project. Therefore operation and maintenance activities will not have an adverse effect on historical resources, and no impact will occur.

Question 4.5b – Archaeological Resource Change

Construction – Less-than-Significant Impact

No archaeological resources are located within the Proposed Project area based on archival information. However, ground-disturbing construction activities—including pole installation, the grading and excavation necessary to develop the proposed Vine Substation site, and trenching activities necessary to install the underground facilities—have the potential to inadvertently impact unknown buried archaeological resources within the Proposed Project area. These activities disturb subsurface soils and can potentially disturb or destroy unknown buried deposits (i.e., archaeological sites). As described previously, the Proposed Project areas have been previously disturbed for the construction of a parking lot and roadways; therefore, the potential to discover unknown archaeological resources is unlikely. SDG&E will implement APM-CUL-01, as described in Section 4.5.4 Applicant-Proposed Measures, to minimize potential impacts to unknown archaeological resources. This APM allows for the halting of work and contacting SDG&E's Cultural Resource Specialist if a cultural resource is discovered. SDG&E will also implement a Safety and Environmental Awareness Program as part of their ordinary construction restrictions. This program will include training regarding the appropriate work practices necessary to effectively implement the APMs and to comply with the applicable environmental laws and regulations, including the potential for exposing subsurface cultural resources. Impacts to unknown resources will therefore be reduced to a less-than-significant level.

Operation and Maintenance – No Impact

Typically, operation and maintenance activities associated with the Proposed Project will not require ground disturbance; however, if ground disturbance is required for the repair of Proposed Project components, it will be conducted in areas that were previously disturbed during construction of the Proposed Project. As no archaeological resources have been identified in the Proposed Project area, impacts to archaeological resources are not anticipated during operation and maintenance of the Proposed Project.

Question 4.5c – Paleontological Resource Destruction

Construction – Less-than-Significant Impact

Direct impacts to paleontological resources occur when earthwork activities—such as mass grading, excavation, and trenching operations—cut into the geological deposits (i.e., formations) within which fossils are buried. These direct impacts occur in the form of physical destruction of

the fossil locality and the contained fossil remains. The top of the Bay Point Formation within the immediate vicinity of the proposed Vine Substation site varies from 3.5 to 11.5 feet below the ground surface (bgs), and the San Diego and Lindavista formations lie below the Bay Point Formation. As shown in Table 4.5-3: Proposed Excavation Depths, the Proposed Project will involve excavations up to 45 feet bgs. Therefore, excavation activities associated with the construction of the Proposed Project have the potential to impact paleontological resources because the potential for discovery of a sensitive paleontological resource is High within the Bay Point and San Diego formations and Moderate within the Lindavista Formation.

Table 4.5-3: Proposed Excavation Depths

Proposed Excavation Activity	Approximate Excavation Depth (feet)
Substation Containment Basins	3 to 4
Substation Equipment Footings	3 to 20
12 kV Distribution Duct Bank Trenches	5.5
12 kV Underground Vaults	7.5
Telecommunication System Duct Bank Trenches	5
Telecommunication System Handholes	3
Tubular Steel Pole Foundation Holes	20 to 45

SDG&E will implement APM-CUL-02, as described in Section 4.5.4 Applicant-Proposed Measures. This APM allows for the halting of work and contacting SDG&E's Cultural Resource Specialist if a paleontological resource is discovered. SDG&E will also implement a Safety and Environmental Awareness Program as part of their ordinary construction restrictions. This program will include training regarding the appropriate work practices necessary to effectively implement the APMs and to comply with the applicable environmental laws and regulations, including the potential for exposing subsurface cultural resources. With implementation of the APM and SDG&E's ordinary construction restrictions, any Proposed Project impacts to paleontological resources will be reduced to a less-than-significant level.

Operation and Maintenance – No Impact

Typically, operation and maintenance activities associated with the Proposed Project will not require ground disturbance; however, if ground disturbance is required for the repair of Proposed Project components, it will be conducted in areas that were previously disturbed during construction of the Proposed Project. As a result, it is not anticipated that paleontological resources will be encountered during such activities, and there will be no impact.

Question 4.5d – Human Remains Disturbance

Construction – Less-than-Significant Impact

No known cemeteries exist and no recorded Native American or other human remains have been previously identified within or adjacent to the Proposed Project area. As such, the potential for

the unintended discovery of Native American or other human remains during subsurface construction activities required for the Proposed Project is considered to be low. If human remains are encountered during the course of construction, work will be halted in the vicinity of the find, and SDG&E will implement the appropriate notification processes as required by law. As a result, any potential impacts will be less than significant.

Operation and Maintenance – No Impact

As previously described, the presence of human remains is considered unlikely in the Proposed Project area. Typically, operation and maintenance activities associated with the Proposed Project will not require ground disturbance; however, if ground disturbance is required for the repair of Proposed Project components, it will be conducted in areas that were previously disturbed during construction of the Proposed Project. As a result, it is not anticipated that human remains will be encountered during such activities, and there will be no impact.

4.5.4 Applicant-Proposed Measures

The following APMs will be implemented as part of the Proposed Project to reduce any potential impacts to cultural or paleontological resources to a less-than-significant level:

- APM-CUL-01: An archaeological monitor will be present during ground-disturbing activities. In the event that cultural resources are discovered, the archaeological monitor will have the authority to divert or temporarily halt ground disturbance to allow evaluation of the potentially significant cultural resources. The archaeological monitor will contact SDG&E's Cultural Resource Specialist and Environmental Project Manager at the time of discovery. The archaeological monitor, in consultation with SDG&E's Cultural Resource Specialist, will determine the significance of the discovered resources. SDG&E's Cultural Resource Specialist and Environmental Project Manager must concur with the evaluation procedures to be performed before construction activities in the vicinity of the discovery are allowed to resume. For significant cultural resources, a Research Design and Data Recovery Program will be prepared and carried out to mitigate impacts. All collected cultural remains will be cleaned, cataloged, and permanently curated with an appropriate institution. All artifacts will be analyzed to identify function and chronology as they relate to the history of the area. Faunal material will be identified to the species level. A monitoring results report—which includes appropriate graphics and describes the results, analyses, and conclusions of the monitoring program—will be prepared and submitted to SDG&E's Cultural Resource Specialist and Environmental Project Manager following completion of the program. Any cultural sites or features encountered will be recorded on appropriate Department of Parks and Recreation forms. All forms and reports will be submitted to the SCIC at San Diego State University.

- APM-CUL-02: A paleontological monitor will be on site to observe excavation operations that involve the original cutting of deposits with high paleontological resource sensitivity (i.e., Bay Point Formation) to depths greater than 3.5 feet. In the event that fossils are encountered, the paleontological monitor will have the authority to divert or temporarily halt construction activities in the area of discovery to allow the recovery of fossil remains. The paleontological monitor will contact SDG&E's Cultural Resource Specialist and Environmental Project Manager at the time of discovery. The

paleontologist, in consultation with SDG&E's Cultural Resource Specialist, will determine the significance of the discovered resources. SDG&E's Cultural Resource Specialist and Environmental Project Manager must concur with the evaluation procedures to be performed before construction activities are allowed to resume. When fossils are discovered, a paleontologist (or the paleontological monitor) will recover them, along with pertinent stratigraphic data. Fossil remains collected during monitoring and salvage will be cleaned, repaired, sorted, cataloged, and deposited in a scientific institution with permanent paleontological collections. A final summary report will be completed that outlines the results of the mitigation program. The report will discuss the methods used, stratigraphic section(s) exposed, fossils collected, and significance of recovered fossils.

RE: Sacred Lands File Search and Native American Contacts list for the **"San Diego Gas & Electric Vine Street Substation Project;"** located in the Downtown San Diego area; San Diego County, California

Dear Ms. Pham:

A record search of the NAHC Sacred Lands File **failed to indicate** the presence of Native American traditional cultural places in the project site(s) submitted as defined by the USGS coordinates configuring the 'Area of Potential Effect' or APE. Also, please note that the absence of archaeological or cultural resources does not preclude their existence at the subsurface level. Other data sources for Native American sacred places/sites should also be contacted. A Native American tribe or individual may be the only sources of information about traditional cultural places or sites.

In the 1985 Appellate Court decision (170 Cal App 3rd 604), the Court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources impacted by proposed projects, including archaeological places of religious significance to Native Americans, and to Native American burial sites.

Attached is a list of Native American tribes, Native American individuals or organizations that may have knowledge of cultural resources in or near the project area (APE). As part of the consultation process the NAHC recommends that local government and project developers contact the tribal governments and individuals in order to determine the proposed action on any cultural places/sacred sites. If a response from those listed is not received in two weeks of notification, the NAHC requests that a follow-up telephone call be made to ensure the project information has been received.

California Government Code Section 65040.12(e) defines "environmental justice" to provide "fair treatment of People...with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations and policies" and Executive Order B-10-11 requires consultation with Native American tribes their elected officials and other representatives of tribal governments to provide meaningful input into

12/19/2013 16:13 FAX 916 657 5390 NAHC 001

the development of legislation, regulations, rules, and policies on matters that may affect tribal communities.

If you have any questions or need additional information, please contact me at (916) 373-3715.

Sincerely,

Dave Singleton
Program Analyst

4.6.0 Introduction

This section describes the existing geologic and pedogenic soil conditions related to the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project). The potential geologic and seismic impacts of the Proposed Project are analyzed and include the potential for exposure of people and structures to substantial adverse effects involving strong seismic ground shaking, fault rupture, liquefaction, unstable soils, landslides, expansive soil, substantial soil erosion, or the loss of topsoil. The evaluation concludes that with adherence to SDG&E's project design methods, and by considering the results and recommendations provided in the Proposed Project-specific geotechnical investigations in the final design, that construction of the proposed Vine Substation, installation and relocation of the distribution circuits, and looping in the existing 69 kV power line will result in less-than-significant impacts to geology and soils.

4.6.1 Methodology

The existing conditions and potential impacts associated with geologic hazards were primarily obtained from the Preliminary Geotechnical and Geological Hazards Investigation prepared by Geosyntec Consultants (Geosyntec) for the Proposed Project site, which is included as Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation. The research and analysis conducted by Geosyntec included a review of regional information and previous geotechnical investigations, as well as pre-investigation activities conducted in support of the soil borings and cone penetration test (CPT) soundings that were taken for the proposed Vine Substation site.[2] Geotechnical laboratory analyses and seismic shear wave velocity measurements were conducted from the borings and CPT soundings to obtain empirical results regarding the subsurface soil characteristics. In addition to the research and analysis provided in Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation, a thorough review of available geologic resource literature relevant to the Proposed Project area was conducted independent of the analyses performed by Geosyntec. The materials reviewed include publications and/or data from the United States Geological Survey (USGS), the California Geological Survey (CGS), California Building Code, and other technical reports and resources. A reconnaissance-level field investigation was also performed on December 10, 2013.

4.6.2 Existing Conditions

Geologic Setting

The Proposed Project area is situated in the western portion of the Peninsular Ranges geomorphic province of Southern California. This geomorphic province encompasses an area that extends approximately 900 miles from the Transverse Ranges and the Los Angeles Basin south to the southern tip of Baja California, and varies in width from approximately 30 to 100 miles. The province is characterized by mountainous terrain on the east, composed mostly of Mesozoic igneous and metamorphic rocks; and relatively low-lying coastal terraces to the west, underlain by Upper-Cretaceous, Tertiary-, and Quaternary-age sedimentary rocks. Most of the coastal region of San Diego County, including the general Proposed Project area, occurs within this coastal region and is underlain by sedimentary rock. Specifically, the Proposed Project site

[2] A geotechnical investigation for the 69 kV tubular steel pole installation sites will also be conducted prior to construction of the Proposed Project.

in this portion of the province is underlain by Late Cretaceous, Eocene, and Oligocene period sediments.

Faults, Seismicity, and Related Hazards

Faults

In comparison to other areas of Southern California, the immediate San Diego area has a relatively quiet seismic history. The historical pattern of seismic activity in coastal San Diego has generally been characterized as a broad scattering of small- to moderate-magnitude earthquakes, whereas the surrounding regions of Southern California—such as the Imperial Valley, northern Baja California, and the nearby offshore regions—are characterized by a higher rate of seismicity. The geologic structure of Southern California is dominated by right-lateral strike-slip faults with a general northwest-by-southwest trend. Regional faults include the Elsinore and San Jacinto faults to the east, the Coronado Bank and San Diego Trough faults offshore to the west, the San Miguel-Vallecitos and Aqua Blanca faults to the south, and the Rose Canyon fault zone (RCFZ), which extends through the general vicinity of the Proposed Project site. The RCFZ is the southern extension of the Newport-Inglewood-Rose Canyon fault zone and is associated with the San Andreas fault system, which forms the tectonic boundary between the North American and Pacific plates.

Fault Rupture

The on-shore portion of the RCFZ extends along the northeast flank of Mount Soledad in La Jolla and continues southward along the eastern margins of Mission Bay. Between Mission Bay and San Diego Bay, the zone widens and diverges. The Alquist-Priolo Earthquake Fault Zoning Act of 1972, formerly known as the Special Studies Zoning Act, regulates construction and development of buildings intended for human occupancy to avoid rupture hazards from surface faults. This act does not specifically regulate overhead power lines, but it does aid in defining areas where fault rupture is most likely to occur. The Proposed Project site is located within a mapped Alquist-Priolo fault zone—the Point Loma quadrangle—in which active portions of the RCFZ have been identified. However, the nearest active portion does not cross the Proposed Project and is located approximately one mile southwest of the Proposed Project site.

Strands of the RCFZ have been mapped within relatively close proximity to the Proposed Project. The smaller, but potentially active La Nacion fault zone lies approximately two miles to the east. As previously mentioned, the RCFZ extends through the general vicinity of the Proposed Project site. In addition, the Proposed Project is located approximately 12 miles east of the Coronado Bank fault zone, and approximately 40 to 45 miles west of the Elsinore fault zone.

Strong Ground Motion

Ground shaking is the seismic effect that results in the vast majority of damage. Several factors control how the ground motion interacts with structures, making the impact hazard of ground shaking difficult to predict. Seismic waves propagating through the earth's crust are responsible for the ground vibrations normally felt during an earthquake. Seismic waves can vibrate in any direction and at different frequencies, depending on the frequency content of the earthquake, its rupture mechanism, the distance from the seismic epicenter, and the path and material through which the waves are propagating.

Strong ground motion or intensity of seismic shaking during an earthquake is dependent on the distance from the epicenter of the earthquake, the magnitude of the earthquake, and the geologic conditions underlying and surrounding the area. The Proposed Project site is located in a seismically active region of Southern California that is subject to significant hazards from moderate to large earthquakes. Ground shaking due to nearby and distant earthquakes should be anticipated during the life of the structure. Based on data from the USGS and from information provided in Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation that was prepared for the proposed Vine Substation site, the predominant fault for this area is the Rose Canyon fault—which is located at approximately 0.2 mile southwest from the Proposed Project site—or one of the previously described regional faults in the Proposed Project vicinity, such as the Elsinore fault.

Active faults are classified as Type A, Type B, or Type C. Type A faults are capable of producing large-magnitude events ($M \geq 7.0$) and have a high rate of seismic activity. Type C faults are not capable of producing large magnitude events and have a relatively low rate of seismic activity. Type B faults are all other faults that are not classified as Type A or Type C. Segments of the San Jacinto and Elsinore fault zones are Type A. Type B faults are the majority of the rest of the seismic faults in the San Diego area and include the RCFZ. The RCFZ is more dominant than the nearest Type A fault zone due to its proximity to the Proposed Project site.

Table 4.6-1: Active Faults in the Vicinity of the Proposed Project lists active earthquake events and estimated site accelerations for the faults considered most likely to subject the Proposed Project area to ground shaking.

The intensity of ground motions induced by earthquakes can be described using peak site accelerations, represented as a fraction of the acceleration of gravity (g). CGS Probabilistic Seismic Hazard Assessment (PSHA) maps were used to estimate peak ground accelerations within the vicinity of the Proposed Project area. Considering the uncertainties regarding the size and location of potential earthquakes and resulting ground motions that can affect a particular site, PSHA maps indicate that there is approximately 10-percent probability of exceeding a peak site acceleration of 0.257g in a 50-year period (Upper Bound Earthquake as defined in Chapter 16 of the 2001 California Building Code) at the proposed Vine Substation site using a magnitude weighting factor based on a 7.5 magnitude earthquake, which equals an annual probability of one in 475 of being exceeded each year.

The Modified Mercalli Scale is another common measure of earthquake intensity, which is a subjective measure of earthquake strength at a particular place as determined by its effects on people, structures, and earth materials. Table 4.6-2: Earthquake Intensity Scale presents the Modified Mercalli Scale for Earthquake Intensity, including a range of approximate average peak accelerations associated with each intensity value. Based on the previously described approximate peak accelerations provided for the Proposed Project site, this area is estimated to fall within Intensity Range VII.

Liquefaction

Liquefaction is the process in which the soil below the water table becomes converted to a fluid state and loses its strength when sufficiently shaken or vibrated during a seismic event.

Table 4.6-1: Active Faults in the Vicinity of the Proposed Project

Fault	Approximate Distance to Proposed Project (miles)	Approximate Fault Length (miles)	Maximum Estimated Earthquake Magnitude
Rose Canyon (San Diego section)	0.2 mile southwest 0.7 mile west	19	7.2
Coronado Bank	11.7 miles west	56	7.6
San Diego Trough	22.1 miles east	93	7.7
San Miguel-Vallecitos	35.0 miles southeast	99	7.8
Agua Blanca	40.0 miles southeast	80	7.0
Elsinore (Julian section)	41.2 miles northeast	112	7.1
Elsinore (Temecula section)	42.4 miles east	26	6.8

Sources: USGS, 2005; Journal of Geophysical Research, 2002; Geological Society of America, 1960; Bulletin of the Seismological Society of America, 1996; California Geological Survey, 2002.

The soil types considered most susceptible to liquefaction are granular, low-plasticity fine-grained soils, which are saturated and have a density that ranges loose to medium. Adverse effects of liquefaction include loss of bearing strength, lateral spreading, sand boils, ground oscillation, and settlement when liquefied ground reconsolidates following the seismic event.

The proposed Vine Substation site is currently occupied by an asphalt-paved commercial parking lot. Soils underlying the paved area and along the underground alignment consist of undocumented fill that typically overlies colluvial deposits and old paralic deposits (previously referred to as the Bay Point Formation) across the site area. Additional detail on soil characteristics are provided in the Soils subsection.

Slope Instability

Strong ground motion can result in rockfall hazards and/or slope instability. The slopes most susceptible to earthquake-induced failure include those with highly weathered and unconsolidated materials on moderately steep slopes, especially in areas of previously existing landslides.

Landslides occur when masses of rock, earth, or debris move down a slope, including rock falls, deep failure of slopes, and shallow debris flows. The actuators of landslides can be both natural events—such as earthquakes, rainfall, and erosion—and human activities. Those induced by man are most commonly related to large grading activities that can potentially cause new slides or reactivate old ones when compacted fill is placed on potentially unstable slopes.

Table 4.6-2: Earthquake Intensity Scale

Intensity Value	Intensity Description	Average Peak Acceleration Range
I	Not felt except by very few people under especially favorable circumstances.	<0.0017g
II	Felt only by a few people at rest, especially on upper floors of buildings. Delicately suspended objects may swing.	0.0017–0.014g
III	Felt noticeably indoors, especially on upper floors of buildings, but many people do not recognize it as an earthquake. Standing motor cars may rock slightly, vibration similar to a passing truck.	
IV	During the day, felt indoors by many, outdoors by few. At night, some awakened. Dishes, windows, and doors disturbed; walls make cracking sound. Sensation is like a heavy truck striking a building. Standing motor cars rock noticeably.	0.014–0.039g
V	Felt by nearly everyone, and many awakened. Some dishes and windows broken; a few instances of cracked plaster; unstable objects overturned. Disturbances of trees, poles may be noticed. Pendulum clocks may stop.	0.039–0.092g
VI	Felt by all, many frightened and run outdoors. Some heavy furniture moves and plaster falls or chimneys are damaged. Damage slight.	0.092–0.18g
VII	Everybody runs outdoors. Damage negligible in buildings of good design and construction; slight to moderate in well-built, ordinary structures; considerable in poorly built or badly designed structures; some chimneys broken. Noticed by people driving motor cars.	0.18–0.34g
VIII	Damage slight in specially designed structures; considerable in ordinary substantial buildings, with partial collapse; great in poorly built structures. Panel walls thrown out of frame structures. Chimneys, factory stacks, columns, monuments, and walls fall. Heavy furniture overturned. Sand and mud ejected in small amounts. Changes in well water. People driving motor cars disturbed.	0.34–0.65g
IX	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb; great in substantial buildings, with partial collapse. Buildings shifted off foundations. Ground cracked conspicuously. Underground pipes broken.	0.65–1.24g
X	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations; ground badly cracked. Rails bent. Landslides considerable from riverbanks and steep slopes. Shifted sand and mud. Water splashed (slopped) over banks.	>1.24g

Intensity Value	Intensity Description	Average Peak Acceleration Range
XI	Few, if any, masonry structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipelines completely out of service. Earth slumps and land slips in soft ground. Rails bent greatly.	>1.24g
XII	Practically all works of construction are damaged greatly or destroyed. Waves seen on ground surface. Lines of sight and level are distorted. Objects are thrown upward into the air.	

Sources: GeoSyntec, 2013

Excavation operations can also contribute to landslides when lateral support is removed near the base of unstable hillside areas. Conditions to be considered in regard to slope instability include slope inclination, characteristics of the soil materials, the presence of groundwater, and degree of soil saturation. The proposed Vine Substation site has been previously graded and is relatively flat with a terrain that slopes gently to the southwest.

Differential Settlement

If the soil beneath a structure settles non-uniformly, the structure can be damaged. The reasons for differential settlement are usually traced to differences in the bearing characteristics of the soils. Alternatively, a portion of the soil beneath a structure may lose strength during an earthquake due to liquefaction. If liquefaction occurs non-uniformly, differential compaction will occur. Unconsolidated or weakened geologic units in the Proposed Project area may be subject to differential settlement; however, the reconnaissance-level survey and geotechnical investigation did not reveal any evidence of differential settling.

Subsidence

Subsidence occurs most often when fluids are withdrawn from the ground, removing partial support for previously saturated soils. More rarely, subsidence occurs due to tectonic down-warping during earthquakes. Neither source of subsidence appears to be present in the Proposed Project area.

Soils

The soils directly underlying the Proposed Project area consist of undocumented fill, colluvium, and old paralic deposits and alluvium. Soil horizons near the surface (from approximately five feet below [existing] ground surface to the surface) are composed of undocumented fill that consists primarily of silty fine sand to fine sandy silt that may contain localized gravels and metal and concrete debris in some areas. The fill layer is underlain by colluvium at depths of 3.5 to 11.5 feet below the ground surface that accumulated at the foot of the slope located east of the proposed Vine Substation site. The colluvium in this area consists of silty fine sand to silt and silty clay that is slightly porous to very porous in nature. Pleistocene-age old paralic deposits (formerly referred to as the Bay Point Formation) also underlie the Proposed Project area and primarily consist of poorly sorted, moderately permeable, reddish-brown, interfingered strandline, beach, estuarine and colluvial deposits composed of siltstone, sandstone, and conflomerate. There is currently no erosion potential at the site because it is covered with asphalt. In the absence of asphalt, exposed soil is anticipated to have a low to moderate erosion potential when considering the slope, slope length, and soil type.

Expansive or Collapsible Soils

Expansive soils are characterized by the ability to undergo significant volume change (i.e., shrink and swell) as a result of variation in soil moisture content. Soil moisture content can change due to many factors, including perched groundwater, landscape irrigation, rainfall, and utility leakage. Expansive soils typically have high clay content and are associated with many of the geologic units throughout the San Diego region. Soils with some expansion potential are present near the surface of the Proposed Project site. The results of two expansion index tests performed as part of the analysis described in Attachment 4.6-A: Preliminary Geotechnical and Geologic

Hazards Investigation determined that the soils near the surface are considered to have a low to medium potential for expansion, with expansion index values ranging between 31 and 51.

4.6.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the California Environmental Quality Act Guidelines. Impacts to geology and soils would be considered significant if the Proposed Project:

- Exposes people or structures to potential substantial adverse effects involving strong seismic ground shaking, fault rupture, liquefaction, or landslides
- Results in substantial soil erosion or the loss of topsoil
- Is located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse
- Is located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property
- Is located on soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater

Question 4.6a – Human Safety and Structural Integrity

i. Earthquake Fault Rupture – Less-than-Significant Impact

During earthquakes, the potential for the ground to rupture can occur either at or below the earth's surface, causing large vertical and/or horizontal displacement of the ground along the fault. Any structures built across or in very close proximity to a fault could experience significant damage in the event of surface fault rupture.

The Rose Canyon fault is the closest mapped active fault and extends nearly onto the Proposed Project site, as it is located approximately 0.2 mile from the Proposed Project site. Review of published geologic maps did not identify the presence of any active or potentially active faults crossing the Proposed Project site. Further, the site is not located within a delineated earthquake fault rupture hazard zone, as defined by the CGS. In addition, the site is not situated in the "Downtown Special Fault Zone," designated by the City of San Diego Seismic Safety Study, and is instead delineated as Geologic Hazard Category 53 (i.e., level or sloping terrain, unfavorable geologic structure, low to moderate risk). Further, as described in Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation, desktop-level and field vaulting evaluations of the proposed Vine Substation site were conducted, and indicated the absence of mapped active or potentially active faulting projecting through the site, and the evaluation of the site subsurface stratigraphy. As described in Section 4.1.3 of Attachment 4.6-A: Preliminary

Geotechnical and Geologic Hazards Investigation, the potential for fault-related surface rupture at the site is low.

Nonetheless, to minimize the potential for damage to occur from rupture of an earthquake fault, the results and recommendations from the geotechnical report will be considered in the final design of the proposed Vine Substation and SDG&E's project design features will also be implemented. The design and construction of the Proposed Project will adhere to all appropriate and applicable codes and seismic standards in order to withstand the maximum predicted ground motion. As described in Section 4.6.0 Introduction, SDG&E's project design features will be adhered to and consideration of the site-specific results and recommendations provided in the geotechnical reports in the final design will reduce impacts related to earthquake fault rupture. As such, the potential for damage caused by fault rupture lurching, or cracking of the ground surface as a result of nearby or distant events, is considered unlikely. Therefore, potential impacts are considered less than significant.

ii. Strong Seismic Shaking – Less-than-Significant Impact

The Proposed Project, including the substation structures and foundations, will be designed to withstand strong seismic accelerations in accordance with SDG&E's project design features to reduce the potential for damage to occur to the proposed facilities in the event of a major seismic event. The design and construction of the Proposed Project will conform to the specific mandated structural design and performance requirements to protect against the effects of strong seismic shaking. In addition, the results and recommendations provided in the Proposed Project-specific geotechnical investigations will be considered in the final design to ensure that Proposed Project components are constructed to withstand strong seismic shaking. With consideration of the existing soil conditions in the final design, the recommendations from the geotechnical reports, and adherence to SDG&E's project design features which comply with all appropriate and applicable codes and seismic standards, the potential for damage caused by strong seismic shaking is considered less than significant.

iii. Ground Failure – Less-than-Significant Impact

As described in Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation, the results of the geotechnical laboratory analyses that were performed on the samples obtained from the geotechnical borings, as well as the CPT soundings that were conducted for the proposed Vine Substation site, indicated that undocumented fill typically overlies colluvial deposits and old paralic deposits (previously referred to as the Bay Point Formation) across the site area. The results of the liquefaction analyses indicate that relatively thin and non-continuous lenses of the old paralic deposits have the potential for liquefaction and that liquefaction may impact the site after development. Liquefaction would most likely be manifested at this site as local ground subsidence, settlement, and localized reduction in shear strength at depth.

The laboratory analyses conducted from the geotechnical borings and CPT soundings revealed that the potential for lateral spreading at the site is considered to be low based on the location of liquefiable soil lenses and the fact that the site and its surroundings are relatively level. As provided in Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation, the magnitude of liquefaction-induced settlement at the proposed Vine Substation site is

anticipated to be relatively small; however, it should be recognized that total and differential settlements may cause damage to surface improvements and subsurface utilities under seismic conditions. As described in Chapter 3 – Project Description, imported fill will be used to replace existing unstable soils at the Proposed Project site. The imported fill will meet SDG&E's standards and the geotechnical engineer's requirements for compaction and stability. In addition, to ensure the Proposed Project is designed to minimize the risk from geological hazards related to ground failure as a result of liquefaction, the SDG&E will also consider the results and recommendations provided in the Proposed Project-specific geotechnical investigations. As a result, impacts related to ground failure, including liquefaction, are anticipated to be less than significant.

iv. Landslides – No Impact

Hazards related to slope instability and landslides are generally associated with foothill areas and mountain terrain, as well as steep riverbanks and levees. The Proposed Project site is relatively flat and does not contain landslide hazards. In addition, the Proposed Project will not result in any new landslide hazards. Therefore, there will be no impact.

Question 4.6b – Soil Erosion or Topsoil Loss

Construction – Less-than-Significant Impact

The proposed Vine Substation will occupy approximately 1.3 acres on a parcel that is currently paved for use as long-term airport parking. The existing pavement will be removed and the lot will be graded during construction of the proposed Vine Substation. Grading will create the potential for soil erosion by removing the existing paved surface and exposing soil during the construction phase of the Proposed Project. Rain and wind have the ability to detach soil particles and transport them off site. However, SDG&E will implement a Storm Water Pollution Prevention Plan (SWPPP) and adhere to its Water Quality Construction Best Management Practices (BMP) Manual, which will minimize soil erosion and reduce impacts to a less-than-significant level. The SWPPP and the SDG&E Water Quality Construction BMP Manual are described in more detail in Section 4.9 Hydrology and Water Quality. In addition, as previously discussed, the Proposed Project site is disturbed and does not contain any valuable topsoil. As a result, impacts will be less than significant.

Construction of the other Proposed Project components will occur within previously disturbed areas and along existing roads where no topsoil is present. Because impacts related to soil erosion will be temporary and controlled through the use of BMPs and because no topsoil will be disturbed, impacts associated with the other Proposed Project components will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Within a developed substation, the potential for erosion is considered low due to the site drainage and surfacing improvements that will be in place. Operation and maintenance of the Proposed Project components will not typically involve ground-disturbing activities or grading. If grading is required, SDG&E will implement the BMPs outlined in its Water Quality Construction BMP Manual. In addition, maintenance vehicles will utilize existing roads to access Proposed Project

areas for routine operation and maintenance activities. Therefore, impacts to soil erosion and topsoil will be less than significant.

Question 4.6c – Geologic Unit Instability – *Less-than-Significant Impact*

As previously described, Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation provides that the proposed Vine Substation site is relatively flat, and new slopes—if proposed at the site—will be engineered slopes designed at stable inclinations. Thus, slope instability is not considered a hazard. The soils located at the proposed Vine Substation site do have the potential for liquefaction. However, the results and recommendations from the Proposed Project-specific geotechnical investigations will be considered and implemented, as needed, to reduce the potential for adverse effects, such as differential settlement, lateral spreading, subsidence, or collapse in the rare occasion that liquefaction does occur. Thus, impacts from geologic instability will be less than significant.

The Proposed Project area is subject to relatively strong seismic shaking due to earthquakes. However, as described previously, the Proposed Project components will be constructed to withstand strong ground movement and moderate ground deformation in accordance with SDG&E's project design features and by considering the results and recommendations from the geotechnical investigations. As a result, impacts from strong ground movements are anticipated to be less than significant.

Question 4.6d – Expansive Soils – *Less-than-Significant Impact*

Soils with expansion characteristics are present near the surface of the Proposed Project site. Based on the plasticity characteristics of the soils encountered (typically indicating silty sand, sandy lean clay, and sandy low plasticity silt) and the results of two expansion index tests performed as part of the current investigation (expansion index values of 31 and 51), the soils near the surface are considered to have a low to medium potential for expansion. As described in Chapter 3 – Project Description, on-site material will be reused to the extent possible, as recommended by a Geotechnical Engineer. Unsuitable (i.e., loose, porous, soft, or expansive) soils will be removed and replaced with imported fill that meets the requirements of SDG&E and the geotechnical engineer's recommendations. In addition, the results and recommendations from the Proposed Project-specific geotechnical investigations will be considered in the final engineering design to reduce risks associated with expansive soils. Thus, impacts related to expansive soils will be less than significant.

Question 4.6e – Septic Suitability – *No Impact*

Soil permeability is a consideration for projects that require septic system installation. Because the Proposed Project will not involve the installation of a septic tank or alternative wastewater disposal system, no impacts will occur.

4.6.4 Applicant-Proposed Measures

The Proposed Project will not result in any significant impacts related to geology and soils; therefore, no applicant-proposed measures are proposed.

Subject: Preliminary Geotechnical and Geologic Hazards Investigation
Vine Substation
San Diego, California
Geosyntec Project: SC0368-30

Dear Mr. Reese:

Geosyntec Consultants, Inc. (Geosyntec) is pleased to provide the San Diego Gas & Electric Company (SDG&E) with the accompanying report presenting the results of our preliminary geotechnical and geologic hazards investigation for the Vine Substation project. Our engineering services were performed in accordance with our proposal dated 6 May 2013, our Agreement No. 6160015028 with the SDG&E Civil/Structural Engineering Group, and Release Order 5660028999. This report presents our conclusions and recommendations pertaining to the project and the results of the field exploration program and laboratory testing.

In our opinion, the site is suitable to develop the proposed substation, provided that the recommendations of this report are incorporated into planning, preliminary design, detailed design, and construction. However, interaction will be required during design development between SDG&E and Geosyntec, particularly with respect to re-evaluation and refinement of remedial grading and deep foundation design recommendations. Design iteration and additional geotechnical investigation will be required to optimize the substation geotechnical design.

We appreciate the opportunity to provide geotechnical support to the project. If you need further assistance, please contact us at (858) 674-6559.

Sincerely,

Jennifer L. Nevius, G.E. 2825
Senior Project Engineer

Alexander J. Greene, C.E.G. 2249
Senior Project Geologist

1. INTRODUCTION

This report presents the results of the preliminary geotechnical and geologic hazards investigation performed by Geosyntec Consultants, Inc. (Geosyntec) for the San Diego Gas & Electric Company (SDG&E) Vine Substation in San Diego, California. This report was prepared for SDG&E and their consultants for project planning and preliminary design by Ms. Jennifer Nevius, G.E. and Mr. Alexander Greene, C.E.G. of Geosyntec. Mr. Steve Fitzwilliam, G.E. of Geosyntec provided senior review.

1.1 Project Description

We understand that SDG&E is proposing to develop a new 69/12 kilovolt (kV) substation on the approximately 1.5-acre site south of Vine Street and west of Kettner Boulevard in San Diego, California (Figure 1 and Figure 2). Geosyntec's understanding of the project is based on discussions with Mr. Edwin Reese, Mr. Chris Bolton, and Mr. Craig Riker of SDG&E. The new substation is anticipated to be energized by December 2016.

A preliminary concept for the grading and arrangement for substation facilities and equipment are shown on Figure 3. Elements of the new substation are anticipated to include typical substation equipment such as switchgears, capacitor banks, firewalls, circuit breakers, transformers, switch gear, switch rack, bus supports, a control shelter, and screen walls. Foundation types for such equipment typically include shallow spread, strip, and mat foundations, or deep drilled pier foundations. Detailed design information is not currently available. Preliminary deep foundation design information for selected structures foundations, including diameters and estimated structural loads from SDG&E standard designs or similar projects are summarized in the following table.

Typical or Preliminary Foundation Design Parameter	Foundation Type		
	Switch Rack	12 kV Terminal Arrestor	Firewall
Diameter (feet)	4	2.5	3
Depth (feet)	14	8	10
Center to Center Spacing (feet)	30	8	8
Center to Center Spacing (diameters, D)	7.5D	3.2D	2.7D
Unfactored Downward Axial Load (kips)	43	0	NA
Unfactored Uplift Axial Load (kips)	1	0	NA
Factored Shear X-direction (kips)	18.6	2.5	NA
Factored Shear Y-direction (kips)	38.8	2.5	NA
Factored Moment X-direction (kips-ft)	406	35	NA
Factored Moment Y-direction (kips-ft)	170	35	NA

a. Notes:
b. Preliminary foundation information provided by SDG&E.
c. Axial loads shown are unfactored; our understanding is that SDG&E typically uses a load factor of 2.0.
d. Factored shear and moment values shown include a factor of 2.0.
e. NA = Not available at this time.

1.2 Purpose and Scope of Investigation

The purpose of this preliminary geotechnical and geologic hazards investigation was to explore the subsurface conditions and provide geologic information and geotechnical engineering recommendations for project planning, design, and construction. The scope of our investigation included a review of previous geotechnical investigations, site reconnaissance, field explorations including geotechnical borings and Cone Penetration Test (CPT) soundings, geotechnical laboratory testing, engineering and geologic analyses and evaluations, and development of the conclusions and recommendations presented herein.

1.3 Report Organization

This report presents our findings and conclusions, and provides geologic information and geotechnical recommendations for the civil and structural design and construction of the project. Specifically, the results of the investigation were used to develop conclusions and recommendations regarding:

- General subsurface conditions;
- Geologic setting;
- Geologic and seismic hazards;
- Earthwork;

- Seismic design considerations, including building code and substation equipment qualification level;
- Allowable vertical and lateral capacities of shallow foundations;
- Parameters for design of axially and laterally loaded drilled pier foundations;
- Estimated foundation settlements;
- Earth pressures for retaining walls;
- Utility trenches;
- Slabs-on-grade;
- Flexible pavements;
- Corrosion potential; and
- Construction considerations.

The previous investigations, geotechnical borings, CPT soundings, geotechnical laboratory testing, and seismic evaluations are provided in the appendices of this report.

2. GEOTECHNICAL INVESTIGATION

This preliminary geotechnical and geologic hazards investigation included a review of published regional geologic information, review of previous site geotechnical information, a site reconnaissance, geotechnical borings, CPT soundings, and geotechnical laboratory testing.

2.1 Review of Regional Information

To develop our understanding of the geologic setting and site history, Geosyntec reviewed the following publically-available documents:

- United States Geological Survey (USGS) Historic Site Aerial Photograph [USGS, 1972];
- Historic Site Aerial Photographs [GoogleEarth, 1994-2013];
- "Maps of Known Active Fault Near-Source Zones, California and Adjacent Portions of Nevada" [California Department of Conservation, Division of Mines and Geology 1998];
- "City of San Diego Seismic Safety Study" [City of San Diego Development Services Department, 2008];
- "Earthquake Fault Zones – Point Loma Quadrangle" [California Geological Survey, 2003]; and
- "Geologic Map of the San Diego 30'x60' Quadrangle, California" [Kennedy and Tan, 2005].

Detailed references for these documents are provided in Section 8 of this report.

2.2 Previous Geotechnical Investigations

The previous site development is not well documented in the referenced information available for review. Our knowledge of previous site conditions is based largely on conditions reported in the previous geotechnical investigations provided by SDG&E. Geosyntec reviewed two site geotechnical investigation reports prepared by Benton Engineering, Inc. (Benton) [1974 and 1977].

The Benton [1974] report documented a preliminary geotechnical investigation for the site that advanced two large-diameter (24- and 36-inch diameter) borings, designated Boring 1 and Boring 2, to depths of 15 feet and 25 feet, respectively, and performed geotechnical laboratory testing for compaction and consolidation characteristics. No groundwater was observed in these borings.

The Benton [1974] investigation concluded that site fill indicated insufficient compaction, and therefore removal and recompaction of fill was recommended for structural support. This report also documents that at the time of the investigation, a retaining wall bounded approximately the northeast portion of the site. Benton [1974] reported that a gas station previously occupied the northeast portion of the site, and the fuel reservoir had been removed. However, no records are referenced within that report, or are currently available to document environmental closure of the gas station, the reservoir removal, or the environmental soil conditions in this area. Figure 3 presents a historical aerial photograph of the site area from the USGS archive [USGS, 1972] which shows two structures in the northeast portion of the site, and landscaping along the retaining wall alignment reported by Benton [1974]; the approximate locations of these features are presented on Figure 2. The Benton [1974] report recommended additional borings for fill and environmental characterization.

The Benton [1977] report documented the results of a supplemental geotechnical investigation to evaluate the removal depths of unsuitable soils. Twelve test pits (designated Test Pit 3 to Test Pit 14) were excavated at the site to depths between 4 feet and 13 feet below the existing ground surface (bgs). The report concluded that loose fill and/or porous alluvium existed to a depth of 0.5 feet in the upper area behind the existing retaining wall and from 2.7 feet to 5.7 feet in the lower area of the site. These unsuitable soils were recommended to be removed and recompacted. The Benton [1977] report indicated that the unsuitable soils in the lower area of the site were to be removed and recompacted in one phase of work, and that in a later phase of work, the unsuitable soils behind the retaining wall would be removed and the retaining wall removed by cutting off the wall 2 feet below the proposed finish grade. No records are available to document that the recommended remedial earthwork was completed or to what extent the retaining wall was removed.

Copies of these Benton investigation reports are presented in Appendix A of this report. The locations of the previous borings, test pits, retaining wall, and site structures are shown on Figure 2 as best approximated from the respective Benton [1974 and 1977] reports and the referenced USGS photograph.

2.3 Pre-Investigation Activities

Prior to commencing our field investigation program, a site- and project-specific health and safety plan was prepared, and Geosyntec contacted Underground Service Alert to coordinate clearance of the proposed exploration locations with respect to below ground utilities. A Geosyntec geologist performed a visual site reconnaissance on 5 July 2013 to evaluate surficial site conditions and to mark out the boring locations for utility clearance.

Due to the proposed depth and the potential to encounter groundwater within the borings and CPT soundings, Geosyntec obtained the required geotechnical construction boring permits from the County of San Diego Department of Environmental Health.

2.4 Geotechnical Borings

The current field investigation included drilling five borings (designated Boring B-1 through Boring B-5), generally located in the four corners and the center of the site, to collect representative geotechnical data. The borings were advanced by Tri-County Drilling, Inc. of San Diego, California using a CME 75 truck-mounted drill rig equipped with 8-inch diameter hollow-stem augers. The borings were advanced on 10 and 11 July 2013 to their target depths of approximately 41.5 feet or 51.5 feet bgs. These boring locations are shown on Figure 2, as located in the field by measured offsets from existing landmarks. A summary of the boring exploration information is presented in Table 1.

The borings were logged by a Geosyntec geologist, and the soil samples classified in accordance with the Unified Soil Classification System (USCS). A key to logs and the individual boring logs are presented in Appendix B of this report. Sampling information and other pertinent field data and observations are included on the boring logs. Due to the reported former presence of a gas station at the site, Geosyntec screened the soil samples in the field for potential indications of contamination (visual or olfactory) using a Photoionization Detector (PID). The PID did not measure volatile organic compounds or other soil vapors from the site soil samples; notations for the PID measurements are presented on the boring logs in Appendix B of this report.

Boring B-2 and Boring B-3 were left open for about one day during the field exploration program with a two-inch diameter slotted poly-vinyl chloride (PVC) pipe installed as a temporary piezometer for groundwater level observation purposes. On 11 July 2013, groundwater level measurements were recorded periodically, and the PVC pipe was subsequently removed prior to backfill of the borings.

After withdrawal of the augers, portions of the unsupported bore holes caved, generally near the observed groundwater level. The free-standing portions of the borings were backfilled with bentonite grout, and hydrated bentonite chips in some instances, and topped with quickset concrete to restore the pavement surface. Investigative derived waste (soil cuttings) from the borings were temporarily stored in a roll-off bin on site, and then transported for disposal at a municipal solid waste landfill.

2.5 Cone Penetration Test Soundings

CPTs are vertical soundings advanced through the soil with a truck-mounted rig providing thrust. Geosyntec engaged Kehoe Testing and Engineering, Inc. (KTE) of Huntington Beach, California to advance CPT soundings in alignments near the southern and northern property boundaries to support geologic and geotechnical site characterization.

The soundings were conducted using a 60-kilopound capacity cone with a tip area of 2.3 square inches. The CPT measures cone bearing, sleeve friction, and dynamic pore water pressure at 1-inch intervals during penetration to provide a nearly continuous geologic log. The CPT soundings were performed in accordance with American Society for Testing and Materials (ASTM) Standard Test Method D5778 [ASTM, 2012]. Measurements of CPT resistance were used to evaluate the variation of material types and engineering properties. Soil Behavior Type (SBT) and stratigraphic interpretation is based on relationships between cone bearing, sleeve friction, and pore water pressure. The friction ratio is a calculated parameter (defined as the ratio of the sleeve friction to cone bearing) and is used to infer SBT. The results of the CPT soundings and interpretive data provided by KTE are presented in Appendix C of this report.

Twenty-six CPT soundings (designated CPT C-1 through CPT C-22) were advanced between 30 July and 2 August 2013 to their target depths or CPT refusal. The CPT soundings were performed to depths ranging from approximately 43 to 100 feet bgs. CPT refusal was encountered in a few localized areas at depths less than 5 feet and between approximately 43 and 60 feet bgs. Where additional CPT sounding attempts were made, those explorations were designated with a sequential letter after the CPT identification numbers (i.e., C-12, C-12A, C-12B etc.). The locations of the CPT soundings are shown on Figure 2, as located in the field by measured offsets from existing landmarks. CPT soundings performed adjacent to geotechnical borings were compared to correlate and validate the SBT. A summary of the CPT exploration information is presented in Table 1.

Seismic shear wave velocity measurements were collected during CPTs C-1, C-8, C-10, C-15, C-16, and C-22 by measuring the travel time and distance between a geophone in the CPT cone and a seismic source (an air-actuated hammer located inside the front jack of the CPT rig) at the ground surface. The shear wave velocity measurements ranged from about 900 to 1,500 feet per second (ft/s) with an average of approximately 1,300 ft/s. A summary of the shear wave velocity measurements is presented in Appendix C of this report.

After withdrawal of the CPT rods, portions of the unsupported holes caved, generally near the groundwater level. The free-standing portions of the CPT holes were backfilled with bentonite grout, and pavements restored using asphaltic cold patch.

2.6 Geotechnical Laboratory Testing

The soil encountered in the borings was visually classified, and soil samples from the borings were tested by GForce of San Diego, California or their subcontractors to evaluate the physical and engineering properties of the material. The laboratory tests were performed in general accordance with ASTM [2012] or other standard test procedures. The geotechnical laboratory tests performed for this investigation are summarized below.

Geotechnical Laboratory Test	Test Designation
Moisture Content	ASTM D2216
Grain Size Analysis	ASTM D422 or D1140
Laboratory Compaction	ASTM D1557
Atterberg Limits	ASTM D4318
Expansion Index	ASTM D4829
Unit Weight	ASTM D2937
Specific Gravity of Soils	ASTM D854
Soil Corrosivity	ASTM D4972, CTM 417, CTM 422
R-value	CTM 301

A suite of tests for chloride and sulfate content, resistivity, and pH were performed on selected soil samples to evaluate their potential corrosivity. One R-value test was performed to evaluate subgrade resistance for pavement design. The laboratory tests and results are summarized at the corresponding sample locations on the boring logs in Appendix B of this report; detailed test results are presented in Appendix D of this report.

3. SITE CONDITIONS

Knowledge of the site conditions was developed from a review of regional geologic conditions, previous geotechnical investigations by others, and the current investigation.

3.1 Regional Geology

The San Diego area is locally underlain by a thick sequence (greater than 5 kilometers [km]) of Mesozoic volcanic flow rocks and volcaniclastic breccias, of which a large portion has undergone low-grade metamorphism. These late Jurassic to early Cretaceous-age rocks have been intruded by a basement of Cretaceous-age granitic rocks of the Peninsular Ranges Batholith. A series of sedimentary rocks from the Late Cretaceous, Eocene, and Oligocene periods overlie the basement and metamorphic rocks and are represented by the Rosario, La Jolla, and Poway Groups, respectively. The sedimentary deposits of the Rosario group unconformably rest upon the deeply weathered basement and rocks, followed by the La Jolla and Poway Group sediments which were deposited during several major marine transgressive-regressive cycles. The next major marine transgression did not occur until the Pliocene when the strata of the San Diego Formation were deposited. The San Diego coastal margin has undergone relatively steady uplift since the deposition of the San Diego Formation and continues today. A series of marine abrasion platforms have evolved during this time and are represented as terraces which contain Pleistocene-age paralic deposits locally [Kennedy and Tan, 2005].

The site lies within the coastal margin along the western flanks of the Peninsular Ranges of southern California. The general site area includes hilly, locally rugged terraced surfaces dissected by numerous drainages extending to the southwest. The site is at the northwest corner of San Diego Bay, which roughly defines a gently folded, fault-bounded, sedimentary basin referred to as the “San Diego Embayment”. A regional geologic map is presented on Figure 4.

3.2 Seismic Setting

The tectonic setting of the San Diego region is dominated by right-lateral, strike-slip faults with a general northwest by southeast trend. Faults of tectonic significance that have been mapped in the San Diego region and the historical earthquake epicenters in the region are presented on Figure 5. These regional faults include the Elsinore and San Jacinto faults to the east, the Coronado Bank and San Diego Trough faults in the offshore zone to the west, the San Miguel-Vallecitos and Aqua Blanca faults to the south, and the Rose Canyon fault zone (RCFZ) which extends through the general

vicinity of the site. These faults and their respective distances from the site and design maximum moment magnitudes are presented in Table 2.

The site is located within the RCFZ, which dominates the seismic exposure in San Diego [Lindvall and Rockwell, 1995]. The RCFZ is the southern extension of the Newport-Inglewood - Rose Canyon fault zone and is associated with the San Andreas fault system which forms the tectonic boundary between the North American and Pacific plates. Together with the Newport-Inglewood fault zone, the RCFZ is considered a continuous zone of five fault segments with a total length of approximately 175 km. Studies in San Diego indicate an estimated slip rate of 1.5 millimeters/year along the RCFZ [Rockwell et al., 1991].

The on-shore portion of the RCFZ extends along the northeast flank of Mount Soledad and continues southward along the eastern margins of Mission Bay. The RCFZ splays out to the south as a number of strands between Mission Bay and San Diego Bay. These strands are known as the Silver Strand, Coronado, and Spanish Bight faults, respectively [Treiman, 2002].

San Diego has experienced strong seismic shaking and minor damage from local and distant earthquakes, but none have been very destructive. A large earthquake in 1862 may have been centered locally [Anderson et al., 1989], and some researchers have suggested the 1862 event could have been in or near San Diego Bay. More recently, San Diego Bay has been the location of several "swarms" of repeated small to moderate magnitude earthquakes. In 1985, a series of earthquakes (largest event was Moment Magnitude [**M**] 4.7) was generally centered just south of the San Diego-Coronado Bridge [Reichle et al., 1985]. The maximum credible earthquake on the Rose Canyon Fault is **M**7.2. In comparison, the **M** of this historic earthquake and the maximum credible earthquake on the RCFZ would correspond to respective local magnitudes (M_L) of approximately 4.7 and between 6.7 to 7.0 on the obsolete Richter Scale.

3.3 Surface Conditions

The site is currently occupied by an asphalt-paved commercial parking lot. The site is bounded respectively to the north, east, south, and west by Vine Street, Kettner Boulevard, the closed portion of Upas Street, and trolley and rail right-of-way to the west. Aerial imagery and topographic information referencing the North American Vertical Datum of 1988 (NAVD 88) is presented on Figure 2 [Project Design Consultants, 2013].

The site has been previously graded and is gently sloping to the southwest. Elevations in the general site area range from approximately +44 feet NAVD 88 near the eastern site boundary along Kettner Boulevard to an elevation of approximately +35 feet to +36 feet NAVD 88 near the western site boundary. From the parking area, a 3-foot to 4-foot high slope ascends to Kettner Boulevard, and an approximately 4-foot high slope descends to the San Diego Metropolitan Transit System right-of-way.

As seen on Figure 2, the low-height slopes are vegetated with a few trees and moderate height brush. A concrete-lined drainage ditch is present at the toe of the descending slope on the west side of the site.

3.4 Subsurface Conditions

The site subsurface conditions were observed and documented in the previous Benton borings and test pit explorations and the recent geotechnical borings and CPT soundings. These explorations indicate that undocumented fill typically overlies colluvial deposits and old paralic deposits (previously referred to as the Bay Point Formation) across the site area. Generalized geologic cross sections are presented on Figure 6 through Figure 9; the locations of these cross sections, previous explorations, and current explorations are presented on Figure 2. Additionally, detailed logs of these explorations are presented in Appendix A (previous investigations), Appendix B (geotechnical borings), and Appendix C (CPT soundings) of this report.

3.4.1 Undocumented Fill

Fill was reported by Benton [1974 and 1977] and observed in the borings and inferred from the CPT soundings performed for this investigation to a depth of approximately 0 to 5 feet bgs in a majority of the subsurface explorations. Benton Boring 2 and Test Pit 14, and Geosyntec Boring B-5 were the deepest reported or observed fill depths at 12.25 feet, 10.5 feet, and 7 feet bgs, respectively. These explorations are approximately located in the central portion of the site, in the area of previous site development. These deeper fill depths may be associated with underground storage tank installation or removal activities.

Records for fill placement and compaction are not available for review; therefore, the fill is considered undocumented fill. The Benton [1977] report indicates that removal and recompaction was planned, but confirming documentation is not available. The fill observed in the Geosyntec borings and reported by Benton consists primarily of silty fine sand to fine sandy silt. Localized gravels were observed in the fill in Geosyntec Boring B-2, Boring B-4, and Boring B-5. Metal debris was observed in the fill at a

depth of approximately 6 feet in Boring B-5, and concrete debris was observed in shallow refusal attempts near CPT C-18C and reported in Benton Test Pit 14.

3.4.2 Colluvium

The native soil immediately below the fill is described as alluvium by Benton [1974 and 1977]; Geosyntec describes these same materials as colluvium. Alluvium refers to materials deposited by flowing streams, whereas colluvium refers to material that accumulates at the foot of a slope, such as the ascending slope to the east of the site, east of Kettner Boulevard. These Quaternary-age materials were not encountered in Boring B-3, but were encountered during the current investigation below the fill to a depth of approximately 3.5 to 11.5 feet bgs in other areas of the site. The consistency of the colluvium was variable in nature and the descriptions range from silty fine sand to silt and silty clay that is slightly porous to very porous.

3.4.3 Old Paralic Deposits

The Bay Point Formation is widespread and well exposed in the area adjacent to the present-day coastline [Kennedy, 1975]. Subsequent geologic mapping efforts have subdivided the Bay Point Formation into a series of paralic and older paralic deposits [Kennedy and Tan, 2005]. These deposits are composed mostly of marine and nonmarine, poorly consolidated, fine- and medium-grained, pale brown, fossiliferous sandstone. These old paralic deposits are considered to be nonmarine slope wash.

Recent geologic mapping (shown on Figure 4) describes the site area as underlain by "Old Paralic Deposits, Unit 6" (Qop_6) of middle to early Pleistocene age [Kennedy and Tan, 2005]. These old paralic deposits (late to middle Pleistocene) rest on the 22-23 meter (m) Nestor terrace; and primarily consist of poorly sorted, moderately permeable, reddish-brown, interfingered strandline, beach, estuarine and colluvial deposits composed of siltstone, sandstone and conglomerate.

3.5 Groundwater

Groundwater was not encountered within the previous Benton explorations performed at the site to depths up to 25 feet bgs. However, groundwater was inferred at the time of drilling of the geotechnical borings performed for this investigation between depths of 24 feet and 25 feet bgs based on measured groundwater level. Groundwater level was also inferred based on other conditions such as soil sample saturation or borehole caving upon auger or CPT rod withdrawal. The observed groundwater levels mimic the site grades and geologic layering, sloping to the southwest. The groundwater was measured at elevations between +11 feet NAVD 88 and +19 feet NAVD 88.

Temporary piezometers were installed in Boring B-2 and Boring B-3, consisting of a 2-inch diameter slotted PVC pipe, installed after drilling and prior to auger withdrawal, to monitor the groundwater level. The groundwater level measured in these temporary piezometers was recorded between approximately 24 feet and 25 feet bgs and is considered to represent relatively stabilized levels, inasmuch as standing water levels were monitored up to about 6 to 18 hours after drilling. However, the subsurface materials at the site generally exhibited a relatively high percentage of silt and clay-sized materials, which reduce permeability. It is possible that the observed groundwater levels in the temporary piezometers may not represent fully stabilized groundwater conditions due to the time rate of travel of groundwater through these materials.

In addition, the field investigation was performed during a season characterized with relatively little rainfall. Seasonal rainfall can influence the position of the groundwater level, with wetter seasons increasing the elevation of groundwater.

Groundwater samples were not collected during this investigation, in accordance with the SDG&E environmental release for the project, because visual or olfactory indications of contamination were not observed in site soil.

3.6 Stratigraphic Correlations

3.6.1 Geologic Cross Section A-A'

Geologic Cross Section A-A' (Figure 6) was created adjacent to the northern site boundary from the southwest to the northeast and includes two borings, one test pit, and eight CPT soundings. Section A-A' suggests that the fill and colluvium within this portion of the site are of relatively uniform thickness and extend to depths of approximately 4 and 9 feet bgs, respectively. Within the underlying old paralic deposits, six stratigraphic packages of alternating silty sands and silts to clays were observed within the limits of our subsurface explorations at respective basal contact elevations between elevation +9 and -30 to -35 feet, NAVD 88. These stratigraphic units exhibit relatively uniform thickness, and range in dip direction from slight westerly in the upper portion of the unit to easterly with increasing depth.

3.6.2 Geologic Cross Section B-B'

Geologic Cross Section B-B' (Figure 7) was created adjacent to the southern site boundary from the southwest to the northeast and includes two borings, three test pits, and 17 CPT soundings. Section B-B' indicates that the fill pinches out in the vicinity of CPT C-13A near the northeastern site boundary; the fill basal contact increases with depth uniformly to the southwest to a maximum thickness of 3 to 4 feet bgs near the southwestern site boundary. The underlying colluvium appears to outcrop immediately

beneath the asphalt surface northeast of CPT C-13A. Similar to the overlying fill, the basal contact of the colluvium increases with depth uniformly to the southwest to a maximum thickness of 10 to 11 feet bgs. Within the underlying old paralic deposits, seven stratigraphic packages of alternating silty sands, sands, and silts to clays were identified within the limits of our subsurface explorations. These stratigraphic units exhibit a gentle westerly dip, and the basal contacts undulate locally resulting in variable unit thicknesses from northeast to southwest.

3.6.3 Geologic Cross Section C-C'

Geologic Cross Section C-C' (Figure 8) was located diagonally across the site from the northwest to the southeast and includes four borings, five test pits, and two CPT soundings. Section C-C' indicates that the thickness of the fill across the site from northwest to southeast is variable, ranging in depth from approximately 3 to 12 feet bgs. The deepest fill appears to be located in the vicinity of the Benton Boring 2. It is possible that the area of the deepest fill was associated with a previous underground storage tank installation or removal; the excavation appears to extend to the underlying old paralic deposits. The colluvial deposits underlie the fill across the majority of Section C-C' except in the vicinity of the deeper fill noted above and within the southeastern portion of the site where it pinches out and fill was observed to overlie the old paralic deposits directly. The basal contact of the colluvium exhibits a uniform westerly dip and ranges in elevation from +38 to +26 feet, NAVD 88, from southeast to northwest, respectively. Old paralic deposits were encountered beneath the colluvium to the maximum extent of the subsurface explorations performed for this investigation. Stratigraphic packages were not interpreted along Section C-C' within the old paralic deposits due to the widely spaced subsurface explorations.

3.6.4 Geologic Cross Section D-D'

Geologic Cross Section D-D' (Figure 9) was located diagonally across the site from south to north, and includes 4 borings, one test pit, and one CPT sounding. Section D-D' indicates that the thickness of the fill is variable from south to north, ranging in depth from approximately 3 to 12 feet bgs. Similar to Section C-C', the deepest fill was observed in the vicinity of Benton Boring 2. The basal contact of the underlying colluvium exhibits a uniform southerly dip, ranging in elevation from +38 to +26 feet NAVD 88, respectively from north to south. The colluvium also maintains a relatively consistent thickness across the site except in the vicinity of the noted deeper fill where it appears to have been removed. Old paralic deposits are encountered beneath the colluvium to the maximum extent of the subsurface explorations performed for this investigation. Stratigraphic packages were not interpreted along Section D-D' within the old paralic deposits due to the widely spaced subsurface explorations.

4. GEOLOGIC HAZARDS

The conclusions and discussions below are based on the current field explorations, previous investigations by others, and geologic interpretation of the site-specific subsurface information.

4.1 Potential Site Faulting

The potential for fault surface rupture is generally considered to be significant along "active" faults (defined as exhibiting surface rupture within the past 11,000 years) and to a lesser degree along "potentially active" faults (surface rupture within the past 1.6 million years).

4.1.1 Desktop Faulting Evaluation

Prior to the field investigation, the position of the site relative to mapped fault traces was evaluated. A review of published geologic maps did not identify the presence of any active or potentially active faults crossing the project site. Further, the site is not located within a delineated earthquake fault rupture hazard zone as defined by the California Geological Survey (CGS), formerly known as the California Division of Mines and Geology [Hart and Bryant, 1997]. In addition, the site is not situated in the "Downtown Special Fault Zone," designated by the City of San Diego Seismic Safety Study [City of San Diego, 2008] and is instead delineated as Geologic Hazard Category 53 (level or sloping terrain, unfavorable geologic structure, low to moderate risk). However, mapped segments of the RCFZ are located to the northeast and west of the site at distances of approximately 650 and 3,600 feet, respectively, and the site is mapped within the RCFZ [USGS and CGS, 2010].

4.1.2 Field Faulting Evaluation

The approach for the field data collection portion of the preliminary fault investigation was to advance explorations in two alignments roughly perpendicular to the direction of mapped faulting along the southern and northern property boundaries and to evaluate the continuity of the subsurface stratigraphy.

Local faults in San Diego are known to exhibit vertical offset (vertical separation), possibly as a result of significant lateral movement. Within an exploratory trench, a discrete planar surface (i.e., a fault plane) can often be directly observed separating dissimilar geologic units. Older geologic units at depth should also exhibit increasing amounts of vertical offset, as the deeper units have accumulated greater relative movement as a result of repeated fault movement over geologic time. Borings and/or CPT soundings on opposite sides of a fault would be expected to penetrate dissimilar

stratigraphy, which would be indicated by strata of varying composition and thickness. Laterally continuous subsurface layers in borings and/or CPT soundings would suggest significant faulting does not pass between the explorations.

The CPT soundings advanced for this project were located at a close spacing (typically less than 10 feet) to reduce the uncertainty of correlating layers from adjacent explorations. If present, multiple laterally continuous layers at increasing depths below the site would increase the confidence that faulting does not exist at the site.

4.1.3 Faulting Evaluation Conclusions

The borings and CPT soundings advanced for this investigation penetrate several stratigraphic units and packages that can be correlated in the subsurface to depths in excess of 80 feet bgs. These units appear to reflect an overall slight west to southwesterly dip component which is common given the geologic setting of much of the western San Diego area. The stratigraphic contacts, which mark the boundary from one material type to another, are generally laterally continuous, although depth variations and thicknesses change across the site were observed in some of the stratigraphic packages; however, this is typical for near shore marine deposits.

The site appears to be underlain by a repetitive sequence of westerly dipping units within the older paralic deposits that are unlikely to have been offset by a fault. It is anticipated that repeated fault movement would induce vertical stratigraphic separations. Geologic cross sections designated Section A-A' and Section B-B' (Figures 6 and 7) were oriented to intercept the anticipated northwest-southeast and northeast-southwest trend of potential faults within the site vicinity. If present, a through-going fault would be expected to exhibit anomalous offsets of the underlying stratigraphic units on one or both of the cross sections. Such subsurface anomalies were not observed and fault related offsets are not indicated within the overlapping site area covered by the two sections. Areas where unit depth and/or thickness variations are indicated over short lateral distances are more difficult to interpret, but are likely to be a result of depositional features such as scoured channels which are typical given the depositional environment of the underlying deposits rather than faulting. Given the absence of mapped active or potentially active faulting projecting through the site, and the evaluation of the site subsurface stratigraphy, it is our opinion that the potential for fault-related surface rupture at the site is low.

4.2 Strong Ground Shaking

The project site is situated within a seismically-active region and will likely experience moderate to severe ground shaking in response to a large magnitude earthquake

occurring on a local or more distant active fault during the expected lifespan of the substation. As a result, seismically-induced ground shaking in response to an earthquake occurring on a nearby active fault, such as the RCFZ, or a regional fault, such as the Elsinore fault zone, is considered to be the major geologic hazard affecting the project. Site-specific seismic design recommendations are presented in Section 5.

4.3 Liquefaction Potential

Seismically-induced liquefaction is a phenomenon in which saturated soils lose a significant portion of their strength and acquire some mobility from seismic shaking or other large cyclic loading. The material types considered most susceptible to liquefaction are granular and low-plasticity fine grained soils which are saturated and loose to medium dense. A rapid increase in groundwater pressures (excess pore water pressures) causes the loss of soil strength.

Manifestations of soil liquefaction can include sand boils, surface settlements and tilting in level ground, lateral spreading, and global instability (flow slides) in areas of sloping ground. The impact of liquefaction on structures can include loss of bearing capacity, drag loads on deep foundations, liquefaction-induced total and differential settlement, and increased lateral and uplift pressures on buried structures.

A summary of the liquefaction potential evaluation methodology, evaluation results, and potential impacts to the project are presented in the following subsections; detailed information regarding the liquefaction evaluation is presented in Appendix E of this report.

4.3.1 Evaluation Methodology

The potential for soil liquefaction can be evaluated based on in-situ measurements of the soil resistance, including Standard Penetration Test (SPT) blow counts in borings, CPT data, and shear wave velocity data. Each form of soil resistance measurement has advantages and disadvantages for the evaluation of liquefaction potential. For the current study, a detailed evaluation of soil liquefaction potential was performed using the CPT data, considering the nearly continuous subsurface characterization and the potential to identify thin layers that would be undetectable with the spatial resolution of the SPT data and shear wave velocity measurements, and in general, the larger number of CPT soundings. Liquefaction potential was evaluated using the Youd et al. [2001] methodology as implemented in the computer program CLiq [GeoLogismiki, 2013].

The procedure for evaluating liquefaction potential was empirical and is based on data and observations at sites that have and have not liquefied during an earthquake. The

capacity of the soil to resist liquefaction is expressed as the cyclic resistance ratio. The seismic demand is a function of the anticipated peak ground acceleration (PGA) at the site generated by the design earthquake and is termed the cyclic stress ratio.

Details of seismic evaluations, including development of PGA and design earthquake magnitude, and liquefaction potential evaluation, are provided in Appendix E of this report. The values of PGA (expressed as units of gravity [g]) and earthquake magnitude used in the liquefaction evaluation were 0.60g and **M**6.6, respectively. The evaluation also utilized the design high groundwater level of 20 feet bgs.

Materials were considered potentially liquefiable if the factor of safety against liquefaction, calculated as the cyclic resistance ratio divided by the cyclic stress ratio, was less than 1.0. Estimates of the liquefaction-induced settlements were calculated using the Zhang et al. [2002] methodology implemented in the computer program CLiq [GeoLogismiki, 2013].

4.3.2 Evaluation Results

The results of the liquefaction analyses indicate that relatively thin and non-continuous lenses of the old paralic deposits have the potential for liquefaction. These layers generally occur within an approximately 40-foot range between the design high groundwater level (20 feet bgs) and -20 feet NAVD 88 (about 60 feet bgs). These analyses also indicate that the liquefaction-induced settlements could range from a fraction of an inch to more than 2.3 inches, with an average value less than 1 inch.

Other factors such as soil mineralogy, void ratio, overconsolidation ratio, and age are contributing factors to liquefaction susceptibility. In general, the older or denser a deposit, the less susceptible it is to liquefaction. Saturated cohesionless sediments within marine terraces of Pleistocene age are reported to have a low likelihood of being susceptible to liquefaction [Idriss and Boulanger, 2008]. In addition, the shear wave velocity measurements from this site, by inspection, suggest a low likelihood of liquefaction. These general conclusions support the results of the more detailed evaluation described above.

4.3.3 Liquefaction Impacts

Liquefaction potential will impact the site design, and may impact the site after development. Liquefaction would most likely be manifested at this site as local ground subsidence, settlement, and localized reduction in shear strength at depth.

The potential for lateral spreading at the site is considered to be low as (i) potentially liquefiable soil lenses do not appear to be continuous across the site; (ii) the site is relatively level; (iii) the potentially liquefiable lenses are located at depth; and (iv) a free face and/or steep slopes are not present in the immediate site vicinity.

Ground improvement to remediate the potentially liquefiable lenses is not considered economically feasible due to the thin and non-continuous lenses of material identified as potentially liquefiable. The magnitude of liquefaction-induced settlement is anticipated to be relatively small (on the order of 1.5 inch); however, it should be recognized that total and differential settlements may cause damage to surface improvements and subsurface utilities under seismic conditions. Foundation design recommendations incorporating the potential impacts of liquefaction are presented in Sections 5.7 and 5.8 of this report.

4.4 Expansive Soil

Soils with some expansion potential are present in the near surface of the site. Based on the plasticity characteristics of the soils encountered (typically indicating silty sand, sandy lean clay, and sandy low plasticity silt) and the results of two expansion index tests performed as part of the current investigation (expansion index values of 31 and 51), the near surface soils are considered to have a low to medium potential for expansion.

4.5 Flooding

The Federal Emergency Management Agency (FEMA) presents the flood hazard potential in the vicinity of the site as part of their Flood Insurance Rate Maps. FEMA Map No. 06073C1885G, dated 16 May 2012 [FEMA, 2012], indicates that the subject area is located in an un-shaded Zone X which is defined as “areas determined to be outside the 0.2% annual change flood plain”. Additionally, due to a lack of any reservoirs up gradient from the site, flooding as a result of dam failure is not considered to be a viable hazard. Based on our review of the FEMA mapping, the geologic setting, and the site elevation, the potential for flooding at the site is very low.

4.6 Hydroconsolidation

Hydroconsolidation is the collapse and compaction of silty to sandy soil having a low bulk density that has been saturated for sustained periods and the water is subsequently removed. Given the location and subsurface conditions observed at the site, when combined with the engineering recommendation provided for site earthwork activities (Section 5.3), the potential for hydroconsolidation is considered to be very low.

4.7 Other Geologic Hazards

Other potential geologic hazards evaluated which could possibly affect the site include slope instability, floods, seiches, and tsunamis. The site is relatively flat, and new slopes, if proposed at the site, will be engineered slopes designed at stable inclinations. Therefore, slope instability is not considered a hazard. Tsunamis are seismically-induced waves generated by sudden movements of the ocean bottom during submarine earthquakes, landslides or volcanic activity. Seiches are similarly generated but are oscillating waves within bodies of water such as reservoirs, lakes or bays. The site is not located within the County of San Diego [County of San Diego Office of Emergency Services, 2009] mapped tsunami run-up zone. Similarly, potential seiche inundation would not likely exceed the extent of tsunami run up. Based on the physiographic setting of this site, the distance to the ocean or other large water bodies, and the elevation of the site, it is our opinion that the potential for flooding from seismically-induced seiches and tsunamis is very low.

5. CONCLUSIONS AND RECOMMENDATIONS

The conclusions and preliminary design recommendations presented herein for the design of the proposed Vine Substation are based on our current understanding of the proposed project, previous investigations by others, and results of our field investigation, laboratory testing, engineering and geologic analyses, and professional judgment.

5.1 Design Development

In our opinion, the site is suitable for the construction of the project, provided the recommendations of this report are incorporated into planning, preliminary design, detailed design, and construction. However, interaction will be required during design development between SDG&E and Geosyntec, particularly with respect to re-evaluation and refinement of remedial grading and foundation design recommendations to optimize the substation design. Information regarding foundation type, layout, preliminary size, and settlement tolerances can be used to more specifically evaluate soil resistance and settlement potential.

5.2 Design Groundwater Level

The project design should incorporate provisions to account for the effect of groundwater. Based on the groundwater levels observed at the time of drilling in the geotechnical borings (24 to 25 feet bgs), and considering the potential for groundwater rise due to seasonal variation or nearby irrigation, a high groundwater level corresponding to a depth of 20 feet bgs is recommended for design.

5.3 Earthwork

Site earthwork will generally consist of demolition of existing site features and pavement, removal of unsuitable (loose, porous, soft, or expansive) soils, site grading and fill placement to construct a relatively level substation pad, foundation excavations, and backfill of utility trenches. Engineered fill is defined as fill meeting the material, placement, and compaction recommendations presented in this report. Earthwork should be performed in accordance with SDG&E requirements, the recommendations of this report, the Standard Specifications for Public Works Construction "Greenbook," and California Occupational Safety and Health Administration (Cal OSHA) safety requirements. A preconstruction conference should be held at the site with SDG&E, the contractor, civil engineer, and geotechnical engineer in attendance. Existing structures identified by SDG&E to remain should be protected in place during earthwork construction.

5.3.1 Site Clearing and Demolition

General debris, construction debris, and vegetative matter in the project area should be cleared and properly disposed of off-site. Existing infrastructure within areas to be improved should be properly demolished and disposed of off-site. Existing utilities should be properly terminated and the portion within the proposed development area removed completely.

A portion of the site was previously developed, reportedly as a gas station. The Benton [1974 and 1977] reports reference a retaining wall (planned to be cut off below grade) and the removal of an underground storage tank at the site. Based on the referenced information, the potential to encounter buried infrastructure such as foundations for walls or buildings, piping, tanks, etc. associated with the previous site development during construction of the proposed site improvements is considered high.

5.3.2 Remedial Grading and Site Preparation

Based on the previous and current borings, the site is underlain by undocumented fill and colluvium to depths up to approximately 3.5 to 9 feet typically, and locally in the central and north-central portion of the site (as reported in Benton Boring 2 and Test Pit 14) up to a depth of approximately 12.5 feet. These materials are conventionally considered unsuitable soils and removed and recompacted to provide uniform support of new fill and structures.

However, the recommended depth of overexcavation and recompaction should be based on anticipated geologic conditions and the proposed development in an area. Given the depths of undocumented fill and colluvium observed and reported in field explorations, it may be impractical to perform full depth remedial grading at this site. Since many of the proposed site structures will be supported on mat foundations, on deep foundations, could tolerate estimated settlements, less than full depth remedial grading should be acceptable.

For preliminary planning and design purposes, we recommend that a minimum of five feet of the undocumented fill and colluvium below existing or finish grade, whichever is lower, be overexcavated and recompacted (if suitable fill material) prior to substation development. Foundation design parameters and estimated settlements provided in subsequent sections of this report incorporate this remedial grading recommendation. The depth of remedial grading should be based upon SDG&E's knowledge of the design criteria, foundation type, and settlement tolerances for the proposed structures and equipment. These recommendations for remedial grading should be reevaluated as part of design development.

In addition, areas to be overexcavated and recompacted should extend a minimum of five feet beyond the footprint of the foundations in each direction. If variable depths of remedial grading are planned, areas of deeper remedial grading should transition to areas of shallower remedial grading to reduce the potential contrast in stiffness between materials. Specific guidelines for such transitions should be determined in the field during grading operations by a representative of the geotechnical engineer.

Due to the geologic conditions and the location of the site within the RCFZ, geologic mapping within the grading limits should also be performed during site earthwork operations to document subsurface conditions. Geologic mapping includes observation and documentation of exposed geologic strata (and potential shears or faults, if encountered) prior to recompaction (fill placement) under the supervision of a certified engineering geologist.

Based on historic site information, a retaining wall reportedly occupied the northeast corner of the site adjacent to the gas station and was planned to be removed by cutting off the wall a few feet below grade. It is likely that concrete debris or foundation remnants from the retaining wall or other structures may be present in the fill at the site. If foundations or other concrete debris greater than 6 inches in maximum dimension is encountered, they should be removed and properly disposed off site. Depending on the depth encountered, removal of such foundations may require localized remedial grading deeper than 5 feet bgs to restore areas disturbed by foundation removal.

Loose or soft soil, or soil disturbed by demolition activities within the proposed grading area, as identified by the geotechnical consultant during grading and foundation excavation, should be excavated or scarified as required, moisture conditioned, and then recompacted before placing additional fill or preparing subgrade. Soil containing organic or other deleterious matter, if encountered, should be removed from the site and properly disposed. Areas to receive new fill, including areas of overexcavation and recompaction, should be proof rolled and moisture conditioned prior to compacting new fill.

5.3.3 Fill Materials

Based on limited observation and laboratory testing performed for this investigation, the on-site fill and formational materials should meet the engineering properties for Common Fill; these materials may not meet the expansion index criteria for Select Fill. The colluvium demonstrated high plasticity characteristics and is not anticipated to meet the requirements for select fill or common fill; however, additional fill suitability confirmation testing should be performed during subsequent geotechnical investigation

during design development or during construction. Biodegradable, organic, or other compressible material should not be used for Common Fill or Select Fill. The following material types are applicable to the project:

Common Fill should consist of native or import soil and be granular soil (less than 50% passing the No. 200 sieve) that has a plasticity index less than 40 and does not contain quantities of oversize material that could make compaction difficult. Rocks or hard lumps less than 6 inches in maximum dimension may be used, provided the distribution of rocks or hard lumps is satisfactory to the geotechnical consultant.

Select Fill should consist of granular native or import soil that contains at least 40 percent of material, by dry weight, less than ¼ inch in size. Select fill should not contain rocks or hard lumps greater than 3 inches in maximum dimension. In addition, select fill should have an expansion index less than 30, a liquid limit less than 30, and a plasticity index less than or equal to 15.

Class 2 Aggregate Base should conform to the State of California, Department of Transportation (Caltrans) "Standard Specifications" Section 26-1.02B.

We recommend that if import soil is needed to achieve the design site grades, the import soil should be non-expansive in accordance with California Building Code (CBC) Section 1803A.5.3. These soils generally correlate to materials with an expansion index of 20 or less and which have a plasticity index of 15 or less.

5.3.4 Fill Placement and Compaction

Fill should be moisture conditioned and compacted between 0 and 3 percent above the optimum moisture contents in layers that do not exceed 8-inch loose lifts for heavy equipment compaction and 4-inch loose lifts for hand-held equipment compaction. Each lift of fill should be compacted to a minimum 90 percent relative compaction unless otherwise specified. Relative compaction is defined as the ratio (in percent) of the in-place dry density to the maximum dry density determined using the latest version of ASTM D1557 as the compaction standard. Fill placed should demonstrate a moisture content within 3 percent of optimum moisture content, also determined with ASTM D1557. Class 2 aggregate base should be compacted to a minimum relative compaction of 95 percent.

SDG&E typical substation requirements include a 3-foot thick substation pad. This pad structural section consists of a 12-inch thick section of select fill compacted to a minimum relative compaction of 90 percent, overlain by a 12-inch thick section of select fill compacted to a minimum relative compaction of 95 percent, overlain by a

12-inch thick section of Class 2 aggregate base compacted to a minimum relative compaction of 95 percent.

5.3.5 Subdrains

Due to the proposed development grades and existing site topography, subdrains are not anticipated as part of the project.

5.3.6 Bulking and Shrinkage

The fill and colluvium may shrink in volume, and the old paralic deposits may bulk in volume when excavated and recompacted in accordance with the recommendations presented in this report. We anticipate that the range of material shrinkage and bulking is on the order of 5 to 10 percent.

5.4 Surface Drainage

Surface drainage should be planned to prevent ponding and promote the drainage of surface water away from structure foundations, slabs, edges of pavements and sidewalks, and towards suitable collection and discharge facilities. Paved and aggregate-surfaced areas should be sloped to drain water away from structures and pavements at a minimum gradient of 1 percent, and unpaved areas should be finish graded with a minimum slope of 2 percent away from structures and pavements. Stormwater collected by roof drainage systems should be discharged at suitable locations away from the structures to reduce the possibility of saturation of foundation soil. Even when these measures are taken, experience has shown that a shallow groundwater or surface-water condition can develop in areas where no such water condition existed before site development.

5.5 CBC Seismic Design Parameters

Seismic design parameters were developed in accordance with the 2010 and the 2013 California Building Code (CBC). The approximate geometric center of the site (latitude and longitude of 32.739 degrees and -117.179 degrees, respectively) was used to evaluate the minimum seismic design parameters presented in Tables 3a and 3b. The structural designer may utilize more conservative values at their discretion.

5.6 Seismic Qualification Level

Based on the Institute of Electrical and Electronics Engineers (IEEE) Standard 693 [IEEE, 2005], "IEEE Recommended Practice for Seismic Design of Substations," we recommend the design of substation equipment use a seismic qualification level of "high". A calculation evaluating the seismic qualification level is presented in Table 4.

5.7 Shallow Foundations

Substation features including control shelters, transformers, and screen walls may be founded on shallow foundations bearing on engineered fill. Shallow foundations may include spread footings, continuous perimeter footings, and mat foundations.

5.7.1 Footing Dimensions and Embedment

The minimum recommended shallow foundation embedment depth is 18 inches below finished grade for spread or continuous foundations or 12 inches below finished grade for larger mat foundations. The minimum recommended shallow foundation width is 18 inches. The structural designer should determine the footing embedment, size, and reinforcement based on anticipated loads and estimated settlements. Adjacent footings founded at different elevations should be located such that the slope from bearing level to bearing level is flatter than 1:1 (horizontal:vertical).

Structures and equipment foundations should not bear on different soil strata (i.e., engineered fill and old paralic deposits). If differing bearing conditions are encountered, the soil should be excavated and recompacted to a depth of at least 3 feet below the bottom of the structure foundation within the perimeter of the structure and at least 5 feet horizontally beyond the structure perimeter.

5.7.2 Allowable Foundation Pressure

Shallow foundations consisting of spread footings, continuous footings, or mat foundations bearing on engineered fill may be designed for an allowable bearing pressure of 2,000 pounds per square foot (psf). The allowable bearing pressure may be increased by 1,000 psf for each additional foot of depth and 500 psf for each additional foot of width beyond the minimum specified foundation dimensions, up to a maximum bearing pressure of 4,000 psf. Allowable bearing pressures may be increased by one-third for short-term wind and seismic loading.

5.7.3 Allowable Lateral Bearing

Resistance to lateral loads on shallow foundations may be provided by passive resistance along the outside face of footings and frictional resistance along the bottom of footings. The allowable passive resistance may be taken as equivalent to a fluid weighing 250 pounds per cubic foot (pcf) for footings poured neat against engineered fill.

An allowable friction coefficient of 0.35 may be used with the dead load to compute the frictional resistance of footings. If frictional and passive resistances are combined, the allowable friction coefficient should be reduced to 0.25.

The upper 12 inches of soil should be neglected in passive pressure calculations in areas where there will be no hardscape that extends from the outside edge of the footing to a horizontal distance equal to three times the footing depth. The resistance from passive pressure should also be neglected where utilities or similar excavations may occur in the future.

5.7.4 Settlement

The settlement of a shallow foundation for a given allowable bearing pressure depends on the size, shape, and embedment depth of the foundation, the relative compaction and stiffness of the engineered fill, and the saturation and density of the soil materials below.

Total settlement from structural loads (excluding seismically-induced settlement) based on the remedial grading recommendations and maximum recommended allowable bearing pressures are summarized below. Differential settlements between adjacent footings are expected to be approximately half the estimated total settlements. The majority of settlement due to structural loads should occur during or shortly after construction.

Shallow Foundation Condition	Estimated Total Settlement (inches)
Continuous foundations less than three feet in width up to a maximum bearing pressure of 4,000 psf	1
Isolated spread or mat foundations less than 25 feet in width up to a maximum bearing pressure of 3,000 psf	1
Isolated spread or mat foundations less than 25 feet in width up to a maximum bearing pressure of 4,000 psf	1.5

Shallow foundations may also be subject to potential liquefaction-induced settlement on the order of 0 to 2.3 inches, with an average of less than 1 inch at the exploration locations evaluated as summarized in Section 4.3.2 and detailed in Appendix E of this report.

5.7.5 Modulus of Subgrade Reaction

Deflections of mat foundations may also be estimated using the subgrade reaction (beam on elastic foundation) method of analysis. We recommend a modulus of subgrade reaction of 200 pounds per cubic inch (pci) for engineered fill.

5.8 Deep Foundations

5.8.1 General

We anticipate that Cast-In-Drilled-Hole (CIDH) deep foundations, also referred to as drilled piers, will be used to support structures such as racks, firewalls, terminal arrestors, and/or other structures with high lateral loads. Preliminary structural foundation design information (Section 1.1) was provided by SDG&E to support development of the preliminary geotechnical foundation design recommendations presented in this section and in Appendix F. We understand that the final foundation sizes, both diameter and depth, will be determined by SDG&E, and will depend on the foundation recommendations provided in this report, the design loads, and construction considerations. We recommend that deep foundations bear within the Old Paralic Deposits. Based on the preliminary design information provided by SDG&E, we anticipate that deep foundations will bear above the design groundwater level.

We understand that the deep foundations at the site may be designed for lateral and axial loading using computer programs such as the Electric Power Research Institute (EPRI) Moment Foundation Analysis and Design (MFAD) or Compression/Uplift Foundation Analysis and Design (CUFAD) programs, or the Ensoft program LPILE, or other spreadsheet or manual calculation methods. Regardless of the design methodology, there are several important considerations for deep foundation design at this site, including soil stratigraphy and design parameters, groundwater level, potential for surficial erosion, and the impacts of potential soil liquefaction.

We recommend the following approach to deep foundation design: 1) SDG&E confirms the preferred extent of remedial grading, equipment layout, foundation type, loads, and size based on the preliminary geotechnical recommendations in this report; then 2) as needed, Geosyntec reevaluates or confirms the deep foundation design recommendations and estimated settlement, analyzing specific foundations identified by SDG&E with respect to potentially liquefiable layers, subsurface modeling conditions, and group effects. Lateral capacity, axial capacity, or settlement may control the design of deep foundations.

Simplified and preliminary subsurface stratigraphy and soil parameters for deep foundation design incorporating the remedial grading recommendations of this report are presented in the following sections. A discussion of the groundwater conditions observed and the design groundwater level are presented in Sections 3.5 and Section 5.2 of this report, respectively. Deep foundation design should incorporate the effects of groundwater by modeling the recommended design groundwater level or buoyant soil unit weights, as appropriate with the foundation length and design methodology utilized. Within a developed SDG&E substation, the potential for erosion is considered low due to the site drainage and surfacing improvements. Additionally, remedial grading is planned. Therefore, due to the anticipated design and construction procedures, no discount depth of surficial materials is recommended for deep foundation design. The potential impact of liquefaction on deep foundation design will require careful consideration at the site as presented in the following section.

5.8.2 Impacts of Liquefaction

Deep foundation design should also consider the potential effects of liquefaction, including drag loads and downdrag settlement. As previously noted, ground improvement to remediate the potentially liquefiable lenses is not considered economically feasible due to the thin and non-continuous lenses of material identified as potentially liquefiable at the site.

Liquefaction-induced drag loads should be incorporated into the axial design of deep foundations. Drag load refers to the downward-acting force transferred to a deep foundation by surrounding soil that undergoes settlement. Load transfer is by shearing stress that develops at the soil-foundation interface. Drag loads occur in response to relative downward deformation of the surrounding soil to that of the foundation. The magnitude of relative movement required to develop full side resistance, and therefore full drag load, is reportedly 0.4 to 0.5 inches. However, it is prudent to assume that full drag loads will occur if any relative downward movement of soil is anticipated. Full drag loads for deep foundations are presented in Appendix F.

Foundation design for lateral loading is typically governed by the subsurface conditions within the upper portion of the soil profile. Since the depth to design groundwater and thus the shallowest potential location of liquefiable lenses is 20 feet bgsliquefied soil layers are not incorporated in the model for the lateral design of deep foundations. However, deep foundations should bear at least 1.5 foundation diameters above the shallowest location of potentially liquefiable lenses (20 feet bgs). The axial soil resistance charts presented in Appendix F terminate above potentially liquefiable layers. The influence of potentially liquefiable soil lenses on axial and lateral design and on

estimated deep foundation settlement should be further evaluated during design development.

5.8.3 MFAD and CUFAD Design Parameters

The design soil parameters utilized in the MFAD and CUFAD computer programs include: subsurface stratigraphy; total unit weight; shear strength parameters; pressuremeter modulus; and various factors related to the soil stress conditions and soil/foundation interface conditions.

Estimates of these parameters were developed based on review of previous geotechnical information, site reconnaissance, field explorations, geotechnical laboratory testing, engineering analyses, empirical correlations, literature research, and professional judgment. Pressuremeter testing was not performed as part of this project. The recommended MFAD and CUFAD design parameters are presented in Table 5 and Table 6, respectively. These design parameters are intended for use in foundation design and may not reflect actual strengths. The ratio of operative to in-situ horizontal stress for CUFAD analysis is based on the specific construction method of the drilled shafts, and should be selected by SDG&E.

5.8.4 LPILE Design Parameters

We understand that SDG&E may perform deep foundation lateral pile analysis and design using the computer program LPILE. The design soil parameters used in lateral pile analysis using LPILE include: subsurface stratigraphy; soil type and p-y curve; effective unit weight; shear strength parameters; and modulus. The estimated LPILE soil design parameters are presented in Table 7. The results of preliminary LPILE modeling are presented in Appendix F.

5.8.5 Axial Resistance and Settlement

Deep foundation axial resistance, potential drag loads, and settlement are dependent on the size of the foundation, loading conditions, and the stratigraphy on the sides and base of the foundation (particularly with respect to the position of the potentially liquefiable layers).

The depth range estimated to have the potential for lenses of soil liquefaction is between the design groundwater level (20 feet bgs) and about 60 feet bgs. Currently, the deep foundations are anticipated to be founded above the design groundwater level, but some relative displacement is anticipated. Relative displacement between the surrounding soil and deep foundations can induce drag loads and downdrag settlement, which is the downward movement of the pile due to settlement of the surrounding ground.

Preliminary axial design information, including downward soil resistance, drag load, and uplift soil resistance for a range of foundation sizes is presented in Appendix F. The recommended drag load for a foundation should be added to the structural loads for foundation design.

Settlements for single foundations induced by the preliminary loads presented in Section 1.1 and by potential drag loads are anticipated to be less than 0.5 inches. This settlement does not include group effects or the potential liquefaction-induced settlement that may occur in soil layers below the foundations (See Section 4.3.2).

5.8.6 Group Effects

Construction of deep foundations in groups can reduce the available axial capacity of drilled piers due to the relaxation of the soil within the adjacent foundation excavations. Deep foundation groups can also demonstrate lower lateral capacity due to overlapping loads from adjacent piles within a group. Deep foundation groups can also demonstrate increased settlement due to the deeper zone of influence for the group than that of a single foundation.

We recommend a minimum center-to-center spacing of 2.5 foundation diameters for deep foundations. However, piers spaced closer than four foundation diameters (center to center) can have a total axial (downward and uplift) capacity less than the sum of the capacities of the individual piers. For preliminary design, we recommend a group efficiency factor for axial design of 0.65 and 1.0 for center-to-center spacing of 2.5 diameters and 4.0 diameters or more, respectively. Axial resistance group efficiency factors for intermediate spacing can be determined by linear interpolation between the noted values.

Group efficiencies for lateral design of deep foundations are presented in Table 8 as recommended for predominantly granular soils and for an individual foundation's location within a group. The lateral group efficiency can be incorporated by magnifying the loads on the piers by the reciprocal of the efficiency.

Additional geotechnical evaluation should be performed during design development to check the group foundation capacity evaluation and settlement.

5.9 Retaining Walls

The site is relatively level; however, recommendations for conventional retaining walls are provided in the event that retaining walls are utilized for grade separations within

the substation. Lateral earth pressures on retaining walls depend upon the type of wall, type of backfill material, and allowable wall movements.

Retaining walls should be backfilled with free draining granular material within a zone defined by a 1:1 (horizontal to vertical) slope up and away from the bottom of the foundation. Free draining granular material is not present in substantial quantities at the site and would require import to the site. Lateral loads on retaining wall foundations can be resisted by passive resistance and frictional resistance for soils adjacent to the foundations as outlined in Section 5.7.3 of this report.

Active lateral earth pressure conditions are applicable for walls which are not fixed at the top and where approximately ¼ inch of movement at the top of the wall per 5 feet of wall height is acceptable. An equivalent fluid pressure of 37 pcf may be used for the design of retaining walls for active earth pressure conditions. This recommended active earth pressure assumes a horizontal backfill surface, free-draining backfill, and does not include surcharge loads. For surcharge loads against the backfilled side of the wall, the resulting lateral load should be calculated based on a uniform lateral pressure equal to 0.5 times the vertical surcharge pressure acting on the backfilled side of the wall, applied over the full height of the wall in addition to the equivalent fluid pressure for walls up to 10 feet high.

5.10 Concrete Slabs and Hardscape

Concrete slabs and hardscape should be supported on select fill with low expansion potential, which may not be present in substantial quantities at the site. A modulus of subgrade reaction of 200 pci can be assumed for design of slabs and hardscape. The subgrade should be proof rolled prior to placing the concrete slabs and hardscape. The slab thickness and steel reinforcement should be designed by a California-registered civil engineer for the anticipated loads. Slab-on-grade concrete floors should have a minimum thickness of 4 inches.

We recommend that isolation joints be provided where slabs abut walls or columns. Isolation joints should be designed to separate the floor from the abutting element, to allow each part to move independently. Crack control or expansion/contraction joints should be provided at spacing appropriate for the slab thickness and the maximum concrete aggregate size, but should be provided at regular intervals not exceeding approximately 15 feet, each way.

Concrete slabs should be underlain by a minimum of 4 inches of clean (less than 5 percent passing the No. 200 sieve), coarse sand. Special care should be taken by the

contractor so that a uniform thickness of sand is maintained to achieve uniformity in the concrete slab thickness. We recommend that the subgrade be wetted prior to placement of the clean, coarse sand beneath the slab. In lieu of the recommended clean, coarse sand, two-sack sand-cement slurry may be used in accordance with SDG&E design practices.

5.11 Utility Trenches

We understand that SDG&E has standards for utility trenches and trench backfill within their substations and for all electric power and distribution trenches outside of the substation consisting of slurry backfill. The following recommendations are meant to be applicable to those utility trenches not covered by the SDG&E standards.

Utilities should be placed above and outside the envelope defined by 2:1 (horizontal to vertical) lines drawn outward and down from the bottom edge of foundations. Trench backfill is defined as material placed in a trench starting 6 inches above the pipe, and bedding is all material placed in a trench below the backfill. Pipe trench backfill should conform to the recommendations presented in this report and Section 306-1.3 of the "Greenbook." Unless concrete bedding is required around utility pipes, free-draining clean sand should be used as bedding. Pavement and subgrade requirements provided in Section 5.10 should be incorporated for trench backfill. Compaction of backfill by water jetting should not be permitted.

5.12 Pavements

We recommend that the paved access roads within the site be designed for a traffic index selected by the project civil engineer. We understand that SDG&E typically utilizes a traffic index of 5.0 for flexible pavement design for substation access roads.

The flexible pavement section should consist of asphalt concrete (as defined in Section 39 of the Caltrans Standard Specifications) over Class 2 aggregate base (as defined in Section 26 of the Caltrans Standard Specifications) over properly prepared subgrade. Properly prepared pavement subgrade consists of the uppermost 12 inches of subgrade that is moisture conditioned and compacted to a minimum relative compaction of 95 percent. Asphalt and aggregate base should be compacted to a minimum relative compaction of 95 percent.

The actual pavement section may be chosen based on the cost for asphalt versus Class 2 aggregate base. We understand that the typical pavement section within an SDG&E substation is 4 inches of asphalt over 8 inches of Class 2 aggregate base; this structural section meets the criteria for the minimum recommended pavement section assuming a

minimum resistance-value for pavement design (R-value) of 5 and a traffic index of 5.0. R-value testing should be performed during construction on samples representative of subgrade conditions to confirm the design assumptions.

Alternatively, portland cement concrete (PCC) can be used for pavements where heavy truck traffic is anticipated. A minimum of 7.5 inches of PCC should be used over properly prepared subgrade. We also recommend that concrete pavements be provided with expansion joints at regular intervals not exceeding 15 feet in each direction.

5.13 Corrosion Potential

The results of the corrosion testing performed for the current investigation are presented in Appendix D of this report. Corrosion testing was performed on two soil samples from this investigation. The results of the tests indicate the water soluble sulfate content and chloride content of the soil were 340 and 310 parts per million (ppm) and 160 and 1,110 ppm, respectively. The results of resistivity testing indicated minimum resistivity values of 1,215 and 265 ohms-centimeters (ohm-cm).

Sulfate contents in this range are generally considered to be negligible with respect to potential for sulfate attack of concrete in accordance with Table 4.2.1 of the 2011 American Concrete Institute Manual. Chloride contents in this range are generally considered to be negligible to high with respect to potential for chloride attack. Minimum resistivity values less than 500 ohm-cm are considered to be very corrosive, and a resistivity value of 1,215 is considered to be fairly corrosive. Metallic utility piping and conduits should be designed for a corrosive environment, and measures to enhance chloride resistance of concrete should be considered. An engineer specializing in corrosion resistance should be consulted if additional information is needed.

5.14 Low Impact Development and Hydromodification

The San Diego Regional Water Quality Control Board Order No. R9-20013-0001 was adopted on 8 May 2013 and became effective on 27 June 2013. This permit regulates discharges of urban runoff from municipal separate storm sewers (MS4s) in the San Diego Region. The MS4 permit requires that new developments and redevelopments implement source control, Low Impact Development (LID), treatment, and hydromodification management BMPs, depending on the type of development. The provisions of the new permit do not go into full effect until 27 June 2015, and until then, the provisions of the previous permit (Order No. R9-2007-0001) govern. The requirements of Order No. R9-2007-0001 and the additional requirements under Order No. R9-2013-0001 are discussed below.

5.14.1 LID and Treatment Control Requirements

Provision D.1.d of Order No. R9-2007-0001 requires each Co-permittee to implement a Standard Urban Storm Water Mitigation Plan designed to control the discharge of pollutants in storm water from the MS4 to the maximum extent practicable. Redevelopment projects that install and/or replace more than 5,000 square feet of impervious area are considered a Priority Development Project under the current City of San Diego Storm Water Standards Manual. The following LID BMPs are required for Priority Development Projects.

Site Design BMP Requirements:

- Drain impervious areas to pervious areas according to the infiltration ability of the pervious area prior to discharge from site;
- Landscape or pervious areas must be properly designed and constructed to function as areas for infiltration of storm water;
- Projects having areas with low traffic and appropriate soil conditions shall construct a portion of the area with permeable surfaces;

  and where applicable and feasible:

- Conserve natural areas, including existing trees, other vegetation, and soil;
- Construct streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised;
- Minimize the impervious footprint of the project;
- Minimize soil compaction; and
- Minimize disturbances to natural drainages (e.g., natural swales, topographic depressions, etc.).

Source Control BMP Requirements:

- Minimize storm water pollutants of concern in urban runoff;
- Include storm drain system stenciling or signage;
- Include properly designed outdoor material storage areas;
- Include properly designed trash storage areas;
- Include efficient irrigation systems; and
- Include water quality requirements applicable to individual priority project categories.

Treatment Control BMP Requirements:

- Select treatment control BMPs to infiltrate, filter, or treat the volume of runoff produced from the runoff from the 85th percentile, 24-hour design storm.

5.14.2 Hydromodification Control Requirements

Priority Development Projects are also required to implement hydromodification control BMPs according to the Hydromodification Management Plan [County of San Diego, 2011]. However, if the project installs/replaces less than 5,000 square feet of impervious area, then the project would be considered a Standard Development Project and the following requirement would not apply.

Section D.1.g of Order No. R9-2007-0001 specifies that for applicable projects "post-project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations." The order further establishes hydromodification control criteria as follows:

> *Priority Development Projects shall implement the following criteria by comparing the pre-development (naturally occurring) and post-project flow rates and durations using a continuous simulation hydrologic model.*
>
> *a) For flow rates from 10 percent of the 2-year storm event to the 10-year storm event, the post-project peak flows shall not exceed predevelopment (naturally occurring) peak flows. Less restrictive standards are possible for more erosion-resistant receiving channel sections if the results from the Southern California Coastal Water Research Project channel screening indicated either a Medium or Low susceptibility to channel erosion.*
>
> *b) For flow rates from the 5-year storm event to the 10-year storm event the post-project peak flows may exceed pre-development (naturally occurring) flows by up to 10 percent for a 1-year frequency interval.*

The MS4 permit also contains language to support exemptions for projects located in highly urbanized areas. This project discharges directly to a hardened conveyance and may qualify for potential exemptions from hydromodification criteria. To qualify for this exemption, the existing hardened conveyance system must continue uninterrupted to the exempt system. Additionally, the project proponent must demonstrate that the

hardened or rehabilitated conveyance system has capacity to convey the 10-year ultimate condition flow through the conveyance system.

5.14.3 Order No. R9-2013-0001 Requirements

Order No. R9-2013-0001 includes a new volume capture criteria which will go into effect in June 2015. This will require Priority Development Projects to implement treatment control BMPs designed to retain (i.e., intercept, store, infiltrate, evaporate, and evapotranspire) onsite the pollutants contained in the design capture volume (DCV). The DCV is equivalent to the volume of storm water produced from a 24-hour 85^{th} percentile storm event. Or, at the discretion of the municipality, the project can incorporate:

- Properly sized biofiltration BMPs if it can demonstrate technical infeasibility of full DCV retention; or
- Properly sized flow-thru treatment control BMPs and offsite mitigation for the portion of the DCV not reliably retained onsite.

The above changes would increase the volume of storm water that would be required to be retained on-site and thus increase the footprint required to address long-term storm water treatment requirements for the project.

5.14.4 LID and Hydromodification Considerations

BMP selection and design is a function of site conditions, especially permeability rates of the underlying soil. The site is located within the hydrologic soil group designated "Undetermined" per the County of San Diego Hydrology Manual [County of San Diego, 2003]. However, a conservative approach is to assume "Group D" soils, which are characterized by a very slow infiltration rate when thoroughly wetted; chiefly clays that have a high shrink-swell potential; soils that have a high permanent water table; soils that have a clay layer at or near the surface; or soils that are shallow over nearly impervious material [County of San Diego, 2003]. The near-surface site materials are considered to have a very low infiltration rate due to the relatively high percentage of silt and clay sized particles.

The near surface site soils are assumed to have a low vertical and horizontal infiltration rate and a slow rate of water transmission. Due to the assumed low hydraulic conductivity of the near surface soils, the role of infiltration in LID and hydromodification control is limited. More specific recommendations can be provided

by Geosyntec, if design development indicates that such BMP features are needed (i.e., storage basin design).

5.15 Additional Geotechnical Investigation

We recommend that additional geotechnical investigation, including subsurface explorations, geophysical surveys, laboratory testing, and engineering and geologic evaluations, is performed prior to final design. Noninvasive geophysical survey exploration methods could potentially delineate underground storage tanks, former tank pits, retaining wall foundations, and utilities or pipelines that may exist in the shallow subsurface, providing information to optimize environmental site assessment and/or support project planning and earthworks construction.

This additional geotechnical investigation should be performed during design development and include additional explorations (potentially including geophysical surveys) to further evaluate subsurface conditions in the specific areas of proposed structures and revisit the preliminary recommendations of this report for completeness and applicability with new information obtained. We recommend installation of a temporary piezometer and groundwater level observation until stabilized in at least one boring. The supplemental investigation should also include additional geotechnical laboratory testing on near-surface materials across the site to further evaluate suitability for re-use as fill.

Geophysical surveys would require closing the site (or portions of the site) to vehicular parking. Multiple geophysical survey methods should be utilized, including electro-magnetic, ground penetrating radar, and liner tracer methodologies, because each instrument senses different properties of the soil and potential buried objects. Electro-magnetic methods highlight buried metallic objects such as pipelines and underground storage tanks. Ground penetrating radar is the primary method applied for the detection of backfilled excavations, trenches, and nonmetallic pipelines and utilities and is also used for detailing anomalies detected with other geophysical instruments. Passive and active line tracer methods delineate pipelines, and active electrical and communication lines.

6. CONSTRUCTION CONSIDERATIONS

6.1 Reuse of Existing Fill Soils and Colluvium

The silty fine sand to sandy silt fill and colluvium is estimated to have a low to medium potential for expansion, and is anticipated to predominantly meet the geotechnical requirements for Common Fill. Two tests performed for this investigation indicated expansion indices of 31 and 51 which would not meet one criterion for Select Fill of an expansion index less than 30. Import of Select Fill materials and/or blending of native material with imported material to meet the Select Fill criteria may be needed.

The existing fill soils and colluvial materials excavated and intended to be reused as engineered fill should also be screened for the presence of contamination and potential for reuse in accordance with SDG&E guidelines. No PID readings or visual or olfactory observations of potential contamination were observed in soil samples and cuttings from the geotechnical borings advanced by Geosyntec. However, this does not preclude the possibility that impacted soil or groundwater is present at the site. The site reportedly was occupied by a gas station and is in an older, developed area of San Diego, with multiple gas stations and vehicle repair/rental facilities in relatively close proximity that can be potential sources of impacts.

During remedial grading, we recommend maintaining separate stockpiles for materials potentially meeting and not meeting the various fill criteria presented in Section 5.3.3 (specifically expansion index) and for potentially impacted soils, if needed.

6.2 Previous Site Development

The site was reportedly occupied by a gas station, with underground storage tank/s and a perimeter retaining wall. As discussed in Section 5.3.1 and Section 5.3.2 of this report, remnants from this development are likely present within the fill, including concrete debris, foundations, utility lines, or other construction debris. As described in Section 3.4.1, minor concrete debris was encountered in the vicinity of CPT C-18 and reported in Benton Test Pit 14.

6.3 Excavation Conditions

The hollo-stem auger borings performed for this investigation were advanced with no unusual difficulty to the target depths up to 51.5 bgs. The CPT soundings met refusal conditions in a few localized instances at depths less than five feet bgs and in a few instances at depths greater than 40 feet bgs. We anticipate that deep foundations can be excavated with easy to moderate effort with conventional heavy-duty drilling equipment.

The borings and CPT soundings performed for this investigation that extended below the groundwater level generally caved upon withdrawal of the hollow-stem augers or the CPT rods. Excavations that extend below the groundwater level (measured during drilling at elevations between +11 feet NAVD 88 and +19 feet NAVD 88) should use casing or other means of excavation stabilization approved by SDG&E.

6.4 Temporary Slopes

The design and excavation of temporary slopes and their maintenance during construction is the responsibility of the contractor. The contractor should have their geotechnical or geological professional evaluate the soil conditions encountered during excavation to determine permissible temporary slope inclinations and other measures required by Cal OSHA. For planning purposes, based on the materials observed in the borings, the design of temporary slopes for planning purposes may assume Type C conditions. Existing infrastructure within a 2:1 (horizontal:vertical) line projected up from the toe of temporary slopes should be monitored for potential movement during construction.

6.5 Construction Observation and Testing

During construction, R-value testing should be performed on subgrade materials below proposed asphalt-paved areas to ensure that the actual subgrade R-value exceeds that assumed for design. Laboratory compaction tests, Atterberg limits tests, and expansion index tests are also recommended during construction to evaluate fill material suitability and compaction requirements. Soil analytical testing may also be required if impacted soils are suspected.

Variations in subsurface conditions will likely be encountered during construction at the site. To permit correlation between the investigation data, design, and the conditions encountered during construction, and to provide conformance with the plans and specifications as originally contemplated, we recommend that Geosyntec be retained to provide continuous observations of earthwork construction operations, including geologic observation and mapping of remedial grading excavations, and to provide quality control testing of soil fill and backfill placement and compaction.

7. LIMITATIONS

The geotechnical investigation for this project observed only a small portion of the pertinent subsurface conditions. The recommendations made herein are based on the assumption that soil conditions do not deviate appreciably from those found during the current field investigation and the referenced previous investigations by others. This geotechnical investigation report has been prepared in accordance with current practices and the standard of care exercised by scientists and engineers performing similar tasks in this area. The conclusions contained in this report are based solely on the analysis of the conditions observed by Geosyntec personnel. We cannot make any assurances concerning the completeness of the data presented to us. Environmental characterization of soil and groundwater was beyond the scope of this investigation.

No warranty, expressed or implied, is made regarding the professional opinions expressed in this report. Site grading and earthwork, subgrade preparation under concrete slabs and paved areas, utility trench backfill, and foundation excavations should be observed by a qualified engineer or geologist to verify that the site conditions are as anticipated. If actual conditions are found to differ from those described in the report, or if new information regarding the site is obtained, Geosyntec should be notified and additional recommendations, if required, will be provided. Geosyntec is not liable for any use of the information contained in this report by persons other than SDG&E or their subconsultants, or the use of information in this report for any purposes other than referenced in this report without the expressed, written consent of Geosyntec.

California, including San Diego County, is an area of high seismic risk. It is generally considered economically unfeasible to design structures to resist earthquake loadings without damage. Proposed structures designed in accordance with the recommendations presented in this report could experience limited distress/damage if subjected to strong earthquake shaking.

Material Type	Depth bgs [a] (feet)	Total Unit Weight (pcf)	Effective Friction Angle (degrees)	Effective Cohesion (psf)	Pressuremeter Modulus, E_{pmt} (ksi)	Shear Strength Reduction Factor, α
Class 2 Base	0 to 1	130	40	0	1.5	1.0
Engineered Fill [b]	1 to 6	120	32	0	1.0	0.9
Undocumented Fill or Colluvium [b]	6 to 13	115	30	0	0.8	0.9
Old Paralic Deposits	>13	130	34	0	3.0	0.8

Notes:

a. The final project grading plan and equipment layout is not available at the time of this report. Design material depths are simplified and preliminary and will require re-evaluation during design development.

b. Existing undocumented fill and colluvium are preliminarily recommended to be removed and replaced with engineered fill to a minimum depth of 5 feet bgs. The depths shown herein represent the deepest interpreted areas of undocumented fill and colluvium.

c. No discount depth is recommended for surficial materials within the substation.

d. The design should consider groundwater below the design depth of 20 feet bgs.

e. pcf = pounds per cubic foot, psf = pounds per square foot, ksi = kips per square inch.

f. The shear strength reduction factor provided is for uncased drilled pier foundation excavations. Other factors should be provided for alternate construction methods.

g. Drilled shafts should bear a distance of at least 1.5 times the shaft diameter above the design groundwater depth of 20 feet bgs.

Table 6. CUFAD Design Parameters

Engineered Fill [b]	1 to 6	120	32	0	60
Undocumented Fill or Colluvium [b]	6 to 13	115	30	0	40
Old Paralic Deposits (unsaturated)	13 to 21	130	34	0	225
Old Paralic Deposits (saturated)	>21	68	34	0	125

Notes:

a. The final project grading plan and equipment layout is not available at the time of this report. Design material depths are simplified and preliminary and will require re-evaluation during design development.
b. Existing undocumented fill and colluvium are recommended to be removed and replaced with engineered fill to a minimum depth of 5 feet bgs. The depths shown herein represent the deepest interpreted areas of undocumented fill and colluvium.
c. No discount depth is recommended for surficial materials within the substation.
d. The design should consider groundwater below the design depth of 20 feet bgs.
e. pcf = pounds per cubic foot, psf = pounds per square foot, pci = pounds per cubic inch.
f. Drilled shafts should bear a distance of at least 1.5 times the shaft diameter above the design groundwater depth of 20 feet bgs.

PRELIMINARY SOILS INVESTIGATION

Introduction

This is to present the results of a preliminary soils investigation conducted at Site No. 1 for the possible Laurel Substation construction. The proposed site is located southwesterly of the intersection of Kettner Boulevard and Vine Street, in San Diego, California.

The objectives of this investigation were to determine the general subsurface conditions of the site and certain physical properties of the soils so that sufficient subsurface information could be developed for site evaluation and selection.

In order to accomplish these objectives, two borings were drilled at selected locations, and both undisturbed and loose soil samples were obtained for laboratory testing.

Field Investigation

The two borings were drilled 24 and 36 inches in diameter, with a truck-mounted rotary bucket-type drill rig at the approximate locations shown on the attached Drawing No. 1, entitled "Location of Test Borings." The borings were drilled to depths of 15 to 25 feet below the existing ground surface. A continuous log of the soils encountered in the borings was recorded at the time of drilling and is shown in detail on Drawing Nos. 2 to 4, inclusive, each entitled "Summary Sheet."

The soils were visually classified by field identification procedures in accordance with the Unified Soil Classification Chart. A simplified description of this classification system is presented in the attached Appendix A at the end of this report.

Undisturbed samples were obtained at frequent intervals in the soils ahead of the drilling. The drop weight used for driving the sampling tube into the soils was the "Kelly" bar of the drill rig which weighs 1623 pounds, and the average drop was 12 inches. The general procedures used in the field sampling are described under "Sampling" in Appendix B.

Laboratory Tests

Laboratory tests were performed on all undisturbed samples of the soils in order to determine the dry density and moisture content. The results of these tests are presented on Drawing Nos. 2 to 4, inclusive. Consolidation tests were performed on representative samples in order to determine the load-settlement characteristics of the soils and the results of these tests are presented graphically on Drawing Nos. 5 to 7, inclusive, each entitled "Consolidation Curves."

Compaction tests were performed on representative samples of the existing fill soil samples found at the site in order to establish compaction criteria. The soils were tested according to the A.S.T.M. D 1557-70 method of compaction which uses 25 blows of a 10 pound rammer dropping 18 inches on each of 5 layers in a 4 inch diameter 1/30 cubic foot compaction mold. The results of the tests are presented as follows:

Boring No.	Bag Sample	Depth in Feet	Soil Description	Maximum Dry Density lb/cu ft	Optimum Moisture Content % dry weight
1	1	1.0-2.0	Silty fine sand fill	119.9	11.4
2	1	1.0-2.0	Silty fine sand fill	108.2	17.4
2	3	9.0-10.0	Silty fine sand fill mottled with clayey fine sand	123.2	12.1

DISCUSSION, CONCLUSIONS AND RECOMMENDATIONS

Soil Strata

At Boring 1, an asphalt concrete paving was found in the upper 0.3 foot of the boring.

The asphalt concrete paving was underlain by loose silty fine sand fills to 3.2 feet. The fill soils were immediately underlain by a loose alluvial deposit consisting of porous silty fine sand and silt soils to 3.7 feet. Below 3.7 feet, a silty fine sand was encountered to the end of boring at 15.0 feet. The silty fine sand was medium firm between 3.7 and 8.0 feet in depth and very firm below.

No ground water was encountered in this boring.

At Boring 2, existing fill soils were found to a depth of 12.2 feet below existing ground surface. The fill soils consisted of loose silty fine sand and medium compact silty fine sand mottled with clayey fine sand. The fill soils were loose in the upper 0.5 foot, medium compact between 0.5 and 11.0 feet in depth and then merged to compact between 11.0 and 12.2 feet in depth. Below 12.2 feet, a medium firm silty fine sand was found to 18.0 feet and then merged to very firm silty fine to medium sand and silty fine sand to the end of boring at 25.0 feet.

No ground water was encountered in this boring.

Conclusions

It is concluded from the results of field explorations and loaboratory tests that the existing fill soils in the upper 3.2 and 12.2 feet, respectively, of Borings 1 and 2 have in-place densities varying from 78 to 89 percent of their maximum dry densities. The majority of the densities fall between 80.3 to 88.7 percent of maximum dry densities. The fill soils in the area of Boring 1 exhibited abrupt consolidation upon saturation with water indicating insufficient compaction at the time of fill placement. It is concluded that the fill soils in this area would have to be removed and recompacted under engineering inspection and testing to assure that these are uniformly compacted to at least 90 percent of maximum dry density and are then satisfactory for structural support.

The fill soils in the upper 12.2 feet of Boring 2 exhibited slight expansion upon saturation with water under a unit load of 1 kip per square foot in accordance with the results of consolidation tests. The fill soils encountered at Boring 2 are generally free of deleterious materials and have satisfactory load-settlement characteristics. However, it is not known whether these fill soils have been uniformly compacted throughout the entire fill area of the upper portion of the site.

Recommendations

In order to better determine the uniformity of the upper fill soils existing in the area of Boring 2, it would be desirable to drill additional borings and sample the soils in this portion of the site.

We were told that the site was an abandoned gas station site, and the fuel reservoir for the former gas station has been removed. The soil conditions around the former fuel reservoir are not known at this time. Additional borings in the former fuel reservoir be desirable to evaluate this area also. More definite conclusions can be drawn as to the suitability of the existing fill soils for load-supporting use once the evaluation of additional test results of the soil samples from additional borings is completed.

Specific recommendations regarding to pavement design, compaction specifications, and soil parameters for footing design will be presented in a supplemental report if the site is selected and we are authorized to complete the laboratory tests on the samples now stored in our laboratory.

Respectfully submitted,

Attention: Mr. E. J. Brancheau

Subject: Project No. 77-2-17D
Report of Investigation to
Determine the Depths for
Removal of Unsuitable Soils
Proposed Site No. 1 of
Laurel Substation
South of the Intersection of
Vine Street and Kettner Boulevard
San Diego, California

Gentlemen:

This is to report the results of observations made on February 22, 1977 in order to determine the depths of unsuitable soils at the subject site.

The approximate locations of twelve additional exploration pits, Nos. 3 to 14, inclusive, excavated on February 22, 1977 are shown on the attached revised Drawing No. 1, entitled "Location of Exploration Pits."

The exploration pits were excavated using a backhoe supplied by the San Diego Gas & Electric Company. The pits were excavated to depths of 4 to 13 feet below the existing ground surface. A continuous log of the soils encountered in the pits was recorded and are described on pages 3 and 4, of this report.

The soils were visually classified by field identification procedures in accordance with the Unified Soil Classification Chart. A simplified description of this classification system is presented in the attached Appendix A at the end of this report.

It is concluded from the observations in the field exploration pits, that loose fill soils and/or porous alluvial soils exist from depths of 2.7 to 5.7 feet below existing grade in the lower area of the site, and to 0.5 foot in the upper area behind the existing retaining wall. Therefore, it is recommended that these unsuitable soils be removed and recompacted under engineering inspection and testing to assure that the recompacted soils are uniformly compacted to at least 90 percent of maximum dry density. The maximum dry density of the soils are to be determined

according to the A.S.T.M. D 1557-70 method of compaction which uses 25 blows of a 10 pound rammer dropping 18 inches on each of 5 layers in a 4 inch diameter 1/30 cubic foot compaction mold.

The recommended depths of removal of the unsuitable fill and porous natural soils are listed below:

Pit No.	Depth of Removal Below Existing Grade in Feet
3	2.7
4	5.7
5	4.3

It is understood that at this time only the unsuitable soils in the lower area of the site are to be removed and recompacted. At a later date the soils behind the existing retaining wall will be removed and the wall cut off at 2.0 feet below the proposed finished grade.

Our office was informed by Mr. George Wiegand that the footing for the existing retaining wall extends approximately 0.5 foot beyond the face of the wall. This would indicate that the footing extends a greater distance underneath the fill behind the wall, therefore, it is our opinion that the unsuitable soils to be excavated in the lower portion of the site can be safely removed outside a slope of one horizontal to one vertical from a point at the top outside edge of the wall footing. The excavation, adjacent to the retaining wall, should be inspected at the time of excavating to verify that the stability of the wall is maintained.

Respectfully submitted,

BENTON ENGINEERING, INC.

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Kettner Substation Relocation project located at Kettner Blvd. & Vine Street in San Diego, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 30, 2013-August 2, 2013. The scope of work was performed as directed by Geosyntec Consultants, Inc. personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at 26 locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
C-1	80	Refusal, groundwater @ 25.0 ft
C-2	74	Refusal, groundwater @ 25.0 ft
C-3	75	Groundwater @ 21.0 ft
C-4	73	Refusal, groundwater @ 24.0 ft
C-5	70	Refusal, groundwater @ 23.0 ft
C-6	66	Refusal, groundwater @ 23.0 ft
C-7	64	Refusal, groundwater @ 23.0 ft
C-8	61	Refusal, groundwater @ 23.0 ft
C-9	48	Refusal, groundwater @ 24.0 ft
C-10	93	Groundwater @ 24.0 ft
C-11	89	Refusal, groundwater @ 21.0 ft
C-12	45	Refusal, groundwater @ 21.0 ft
C-12B	45	Refusal, groundwater @ 22.0 ft
C-13	43	Refusal, groundwater @ 21.0 ft
C-13A	80	No cave depth taken
C-14	90	Groundwater @ 24.0 ft
C-15	80	Groundwater @ 24.0 ft

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
C-16	90	Groundwater @ 27.0 ft
C-17	100	Groundwater @ 27.0 ft
C-18	4	Refusal, hole open to 4.0 ft (dry)
C-18A	4	Refusal, hole open to 4.0 ft (dry)
C-18C	80	Groundwater @ 27.0 ft
C-19	80	Groundwater @ 26.0 ft
C-20	58	Refusal, groundwater @ 25.5 ft
C-21	80	Groundwater @ 25.0 ft
C-22	100	Groundwater @ 25.0 ft

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone and recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At location C-1, C-8, C-10, C-15, C-16 & C-22, shear wave measurements were obtained at approximately 10-foot intervals. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

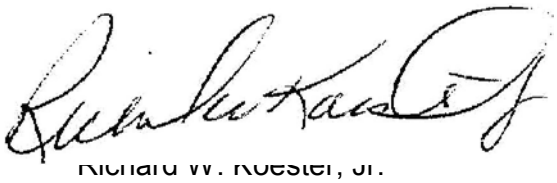
Tables of basic CPT output from the interpretation program CPeT-IT are provided for CPT data averaged over one foot intervals in the Appendix. Spreadsheet files of the averaged basic CPT output and averaged estimated geotechnical parameters are also included for use in further geotechnical analysis. We recommend a geotechnical engineer review the assumed input parameters and the calculated output from the CPeT-IT program. A summary of the equations used for the tabulated parameters is provided in the Appendix.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING



Richard W. Koester, Jr.
General Manager

S-Wave Velocity from Surface = Travel Distance/S-Wave Arrival
Interval S-Wave Velocity = (Travel Dist2-Travel Dist1)/(Time2-Time1)

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236\right)$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952-3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52-1.37 \cdot I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a}\right) \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

:: Young's Modulus, Es (MPa) ::

$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$

(applicable only to $I_c < I_{c\_cutoff}$)

:: Relative Density, Dr (%) ::

$100 \cdot \sqrt{\frac{Q_{tn}}{k_{DR}}}$ (applicable only to SBT_n: 5, 6, 7 and 8 or $I_c < I_{c\_cutoff}$)

:: State Parameter, ψ ::

$\psi = 0.56 - 0.33 \cdot \log(Q_{tn,cs})$

:: Peak drained friction angle, φ (°) ::

$\varphi = 17.60 + 11 \cdot \log(Q_{tn})$

(applicable only to SBT_n: 5, 6, 7 and 8)

:: 1-D constrained modulus, M (MPa) ::

If $I_c > 2.20$

$\alpha = 14$ for $Q_{tn} > 14$

$\alpha = Q_{tn}$ for $Q_{tn} \leq 14$

$M_{CPT} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \leq 2.20$

$M_{CPT} = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Small strain shear Modulus, Go (MPa) ::

$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Shear Wave Velocity, Vs (m/s) ::

$$V_s = \left(\frac{G_0}{\rho}\right)^{0.50}$$

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 10.50 + 7 \cdot \log(F_r)$ or user defined

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c\_cutoff}$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$S_{u(rem)} = f_s$ (applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c\_cutoff}$)

:: Overconsolidation Ratio, OCR ::

$$k_{OCR} = \left[\frac{Q_{tn}^{0.20}}{0.25 \cdot (10.50 \cdot +7 \cdot \log(F_r))}\right]^{1.25}$$ or user defined

$OCR = k_{OCR} \cdot Q_{tn}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c\_cutoff}$)

:: In situ Stress Ratio, Ko ::

$$K_O = 0.1 \cdot \left(\frac{q_t - \sigma_v}{\sigma'_{vo}}\right)$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c\_cutoff}$)

:: Soil Sensitivity, S_t ::

$$S_t = \frac{N_S}{F_r}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c\_cutoff}$)

:: Effective Stress Friction Angle, φ' (°) ::

$\varphi' = 29.5° \cdot B_q^{0.121} \cdot (0.256 + 0.336 \cdot B_q + \log Q_t)$

(applicable for $0.10 < B_q < 1.00$)

Subject: Seismic Evaluations
Vine Substation
San Diego, California

Dear Ms. Nevius:

This letter report presents the results of the seismic evaluations performed by Geosyntec Consultants, Inc. (Geosyntec) to support planning, design, and construction of the proposed Vine Substation in San Diego, California.

PROJECT DESCRIPTION

San Diego Gas and Electric Company (SDG&E) plans to relocate the existing Kettner Substation from its current location south of Palm Street and west of Kettner Boulevard to its new location south of Vine Street and west of Kettner Boulevard (site) in San Diego, California. The project was previously called "Kettner Substation Relocation", but has been renamed, as the Kettner Substation will remain in operation. The approximate location of this site with respect to the major highways in the area is shown on Figure 1.

A plan view of the site is shown on Figure 2; the site extends over approximately 1.5 acres and is presently developed as a commercial parking lot. The approximate coordinates of the geometric center of the site are 32.739 North Latitude and -117.179 West Longitude.

PURPOSE AND SCOPE OF EVALUATIONS

The purposes of these engineering evaluations were: (i) assessment of soil liquefaction potential at the site; (ii) evaluation of soil liquefaction impacts, if any; and (iii) development of seismic parameters for structural design.

To achieve these objectives, Geosyntec:

- Evaluated seismic hazard parameters;
- Developed design ground motions;
- Performed site response analysis;
- Evaluated soil liquefaction potential;
- Evaluated soil liquefaction-induced site impacts; and
- Developed structural design parameters.

The above outlined engineering evaluations were based upon site-specific geological, hydrogeological, and geotechnical information.

SUBSURFACE CONDITIONS

Knowledge of the site subsurface conditions was developed from a review of regional geologic conditions, previous geotechnical investigations by others, and the current investigation.

Benton [1974; 1977] previously performed investigations at the site that included hollow stem drilling, excavation of test pits, and geotechnical laboratory testing. For the current study, Geosyntec [2013] advanced five borings and twenty six Cone Penetration Test (CPT) soundings, and performed geotechnical laboratory testing. Six of these CPT soundings also included shear wave velocity measurements.

The approximate location of these explorations are shown on Figure 2 along with the locations of geotechnical cross-sections (designated as Section A-A' through Section D-D') developed by Geosyntec [2013]. These cross-sections are reproduced herein on Figure 3 (Section A-A'), Figure 4 (Section B-B'), Figure 5 (Section C-C') and Figure 6 (Section D-D'). These cross-sections indicate that the site has been graded in the past, with fill thickness extending up to approximately 12 feet below the existing ground surface (bgs). The underlying colluvium and old paralic deposits are very gently sloping alternating layers of silty sand (SM), clayey sand (SC), low plasticity silt (ML) and low plasticity clay (CL).

Groundwater, as observed in boreholes and inferred from the CPT soundings, was estimated at approximately 24 to 25 feet bgs. However, information on the depth to

bedrock that is required for execution of site response analysis is lacking and cannot be inferred from existing information.

Inferred site stratigraphy and the moist unit weight profile established as representative of broader site conditions is presented on Figure 7. Moist unit weight profile was determined by previous and current geotechnical laboratory test data and correlation to representative CPT data (CPT C-1, C-8, C-15, C-16, and C-22).

Similarly, Figure 8 presents shear wave velocity (V_s) profile established as representative of the broader site conditions. This profile was determined by evaluation of the V_s data collected from CPTs C-1, C-8, C-10, C-15, C-16, and C-22. The average V_s over the top 100 feet, or approximately 30 meters, of the profile (V_{s30}) is 1,300 feet per second (ft/s). Based upon this information, the site may be classified as Site Class C in accordance with the site classification scheme presented in the International Building Code (IBC) and adopted by the 2013 edition of the California Building Code (2013 CBC).

EVALUATION OF SEISMIC HAZARD PARAMETERS

Geosyntec performed probabilistic seismic hazard analysis (PSHA) to evaluate seismic hazard parameters at the geometric center of the site. The PSHA was performed for:

- Free-field site conditions that are representative of conditions at the top of soil profile at the site; and
- Hypothetical bedrock outcrop conditions that are representative of bedrock underlying the site.

The geometric center of the site was established at approximate geographic coordinates are 32.739 North Latitude and -117.179 West Longitude. A V_s value of 2,500 ft/s was assigned to the hypothetical bedrock outcrop at the site based upon Burger [1992]. The evaluation for free-field site conditions was performed for V_{s30} equal to 1,300 ft/s that was established based upon site-specific measurements.

To establish the design earthquake, probabilistic seismic hazard analysis was performed for an event with 2% probability of exceedance (PE) in 50 years by the means of the United States Geological Survey (USGS) on-line tools. The latest available (i.e., 2008) USGS database was used for this evaluation.

The results of the probabilistic seismic hazard analysis are presented on Figures 9 and 10. Figure 9 indicates that seismic hazard at the site is governed by a Moment Magnitude (**M**) 6.64 event on the San Diego section of Rose Canyon Fault Zone (RCFZ). Figure 9 further indicates that the RCFZ is approximately 1 km (0.6 miles) from the geometric center of the site. Figure 10 compares bedrock outcrop and free-field ground surface (target) acceleration response spectra (5% viscous damping) and shows a characteristic shift to the right when bedrock conditions transition to the free-field soil conditions.

As shown on Figure 10, the 2% PE in 50 years free-field Peak Ground Acceleration (PGA) is 0.60 g. This PGA, along with **M**6.64, may be used for evaluation of soil liquefaction potential at the site. The bedrock outcrop Peak Horizontal Ground Acceleration (PHGA) is 0.56 g.

EVALUATION OF DESIGN GROUND MOTIONS

In order to characterize design ground motions in time domain, Geosyntec established a suite of five acceleration time histories (design ground motions; accelerograms) for the site. As the depth to bedrock cannot be inferred from existing field exploration data, the design ground motions were initially selected to conform to the ground surface (i.e., free-field soil conditions) target spectrum. The selection process was as follows:

- Screen the Next Generation Attenuation (NGA) database of acceleration time histories on the basis of site conditions, earthquake magnitude, and PGA similar to those established for the site;
- Plot the acceleration response spectra of the candidate accelerograms (24 motions) against the target soil acceleration response spectrum; and
- Out of 24 candidate motions, select 5 motions that most closely conform to the target free-field (soil) spectrum over a broad range of periods.

Following the above outlined methodology, Geosyntec established a suite of 5 design accelerograms that conform to the target soil spectrum. These accelerograms include:

- The NGA No. 1095 accelerogram, recorded in the 1994 **M**6.7 Northridge, California earthquake at the Whittier - S. Alta Drive station;
- The NGA No. 730 accelerogram, recorded in the 1988 **M**6.8, Spitak, Armenia earthquake at the Gukasian station;

- The NGA No. 2550 accelerogram, recorded in the 1999 **M**7.6 Chi-Chi, Taiwan earthquake at the HWA050 station;
- The NGA No. 1012 accelerogram, recorded in the 1994 **M**6.7 Northridge earthquake at Los Angeles 00 station; and
- The NGA No.: 1056 accelerogram, recorded in the 1994 **M**6.7, Northridge earthquake at Phelan Wilson Ranch station;

The acceleration response spectra of the above listed accelerograms, scaled to a free-field (soil) PGA of 0.60 g, are plotted against the free-field (soil) target acceleration response spectrum on Figure 11. Figure 11 indicates that the acceleration response spectra of these accelerograms match and/or exceed the target acceleration response spectrum over a broad range of periods. Therefore, these accelerograms scaled to a PGA of 0.60 g are selected for use in site response analysis.

SITE RESPONSE ANALYSIS

General

Geosyntec conducted a site response analysis to evaluate the response of the site to design ground motions. As depth to bedrock cannot be inferred from existing information, a deconvolution of design ground motions was performed first to assess depth to bedrock. Once depth to bedrock was assessed, a conventional site response analysis was performed. The purpose of the conventional site response analysis was to develop input parameters for evaluation of soil liquefaction potential at the site.

Dynamic Response Model

The dynamic response model for both deconvolution of design ground motion and for site response analysis was developed for the geometric center of the site. The average unit weight and average shear wave velocity profiles that form a backbone of this model are shown on Figures 7 and 8. As indicated in Figures 7 and 8, moist unit weight of 116 pounds per cubic foot (pcf) was assigned within top 10.5 feet of the profile, while 128 pcf was assigned within the remainder of the profile, with a constant value of shear wave velocity of 1,300 ft/s applied over the entire profile.

Also indicated in Figures 7 and 8 is the inferred stratification (layering) of the site and associated material characterization. The particular material classification and confining stress calculated from the average unit weight profile served as a basis for selection of nonlinear properties of on-site soils. In particular, Geosyntec selected the stress and

Plasticity Index-dependent Darendeli [2001] modulus reduction and damping curves for development of site response analysis model.

Both the deconvolution of design ground motion and site response analysis were performed in frequency domain using the latest iteration of one-dimensional equivalent-linear site response analysis program SHAKE [Schnabel et al., 1972]. In particular, Geosyntec employed SHAKE2000 [www.GeoMotions.com].

Deconvolution of Design Ground Motions

The principle of the deconvolution of design ground motion is schematically presented on Figure 12. As depicted, the deconvolution analysis starts with propagation of a design ground motion downward, from the free-field ground surface to an assumed elevation of bedrock. The results are monitored in a form of calculated acceleration response spectrum at the assumed bedrock level and are compared to the target bedrock spectrum that was evaluated as a part of seismic hazard analysis. If a reasonable agreement between the calculated acceleration spectrum and the target bedrock spectrum is obtained, the process is repeated with other accelerograms in the suite of design accelerograms. If the agreement is judged not to be satisfactory, depth to bedrock is increased and the process is repeated until the satisfactory agreement is obtained.

The results of deconvolution analysis are shown on Figure 13. These results indicate that: (i) bedrock at this site is at an approximate depth of 200 ft bgs; and (ii) the predominant period of this site, evaluated as (4 x 200 ft)/$V_{s,average}$ = 0.62 seconds.

The acceleration time histories calculated by deconvolution at a depth of 200 ft bgs (see acceleration response spectra of these time histories on Figure 13) can be used for site response analysis at this site.

Site Response Analysis

The purpose of the conventional site response analysis was to develop input parameters for evaluation of soil liquefaction potential at the site, namely to establish a profile of design Earthquake Cyclic Stress Ratio (CSR_{EQ}).

The site response analysis was performed using the 200-foot high one-dimensional site model shown on Figures 7 and 8. The results are presented on Figure 14 in a form of calculated and an average CSR_{EQ} profiles. Figure 14 further indicates that a relatively narrow band of CSR_{EQ} was calculated across the entire profile. Therefore, the average

calculated CSR_{EQ} profile can be used for evaluation of soil liquefaction potential at this site.

ASSESSMENT OF SOIL LIQUEFACTION POTENTIAL

Soil liquefaction potential was evaluated using the Youd et al. [2001] procedure, as coded in the computer program CLiq [GeoLogismiki, 2013]. The analysis was performed for individual CPT soundings. A "design high" groundwater elevation of approximately 20 feet bgs was assumed for soil liquefaction analysis [Geosyntec, 2013].

The CSR_{EQ} profile evaluated as a part of site response analysis was directly input into CLiq. A "thin-layer" correction procedure [Robertson and Wride, 1998] was implemented to account for presence of thin layers of high permeable soils (e.g., sands) that are locally "sandwiched" between relatively thick layers of low permeable soils (e.g., clays).

A summary of the liquefaction evaluation results are shown on Figures 15 and 16; detailed results of the liquefaction analysis are presented in Attachment A to this letter. The results of seismic evaluations documented herein indicate that relatively thin and isolated lenses of saturated sandy soil may liquefy during the design earthquake. These lenses are unevenly distributed within the top 60 feet of the profile. The lens thickness approximately ranges from 1.5 to 5 feet with an average thickness of 2.6 feet.

ASSESSMENT OF SOIL LIQUEFACTION IMPACT

Potential impacts of soil liquefaction at this site include:

- Surface manifestation;
- Lateral spreading;
- Total and differential downdrag settlement of deep foundations; and
- Drag load on deep foundations.

By inspection, we judge that potential for surface manifestation of soil liquefaction is small as the "crust" of non-liquefiable soils is over 30 ft thick. Also by inspection, we further judge that potential for lateral spreading at this site is low as: (i) potentially-liquefiable soil lenses do not appear to be connected; (ii) the site is relatively level; (iii)

a free-face and/or steeply sloped site conditions do not exist in a relative vicinity of the site; and (iv) the depth to the potentially liquefiable soils is relatively high.

The magnitude of soil liquefaction-induced settlement calculated for each CPT sounding is relatively small; the calculated values range from a fraction of an inch to 2.3 inches, with an average value of 0.8 inches. As Building Departments in southern California typically limit allowable (total) settlement to 4 inches and allowable (differential) settlement to 1 inch over a standard 30-foot span, we judge that the impact of soil liquefaction-induced settlement on proposed development is small.

While the average magnitude of liquefaction-induced settlement is relatively small, soil liquefaction may induce drag loads and downdrag on deep foundations. Therefore, design of deep foundations should include additional drag loads in the top 60 feet of the site profile.

PARAMETERS FOR STRUCTURAL DESIGN

Geosyntec evaluated the design spectral response acceleration parameters in accordance with the requirements of the 2010 and 2013 Editions of the CBC. The calculations are in accordance with site classification established above (Site Class C), and include the following:

$$S_{MS} = F_a S_s$$

$$S_{M1} = F_v S_1$$

and

$$S_{DS} = 2/3\ S_{MS}$$

$$S_{D1} = 2/3\ S_{M1}$$

where S_s and S_1 are mapped spectral response accelerations at 0.2 s and 1.0 s periods respectively. F_a and F_v are site coefficients (herein corresponding to Site Class C) at 0.2 s and 1.0 s periods respectively. S_{MS} and S_{M1} are adjusted maximum considered earthquake spectral response accelerations at 0.2 s and 1.0 s periods correspondingly. S_{DS} and S_{D1} are design spectral acceleration parameters at 0.2 s and 1.0 s periods.

We understand that the Structural Engineer will select the edition of building code upon which structural design will be based. Geosyntec offers spectral response acceleration parameters for the two latest editions of CBC, as presented in Tables 1 and 2. Output from the USGS tool utilized to confirm the seismic design parameters is presented in Attachment B to this letter.

Table 1. 2010 CBC Seismic Parameters
Vine Substation
San Diego, California

Parameter [a]	Value
Site Soil Class	C
Mapped Spectral Response Acceleration at 0.2 s Period, S_S	1.60 g
Mapped Spectral Response Acceleration at 1.0 s Period, S_1	0.63 g
Short Period Site Coefficient at 0.2 s Period, F_a	1.00
Long Period Site Coefficient at 1.0 s Period, F_v	1.30
Adjusted Spectral Response Acceleration at 0.2 s Period, S_{MS}	1.60 g
Adjusted Spectral Response Acceleration at 1.0 s Period, S_{M1}	0.81 g
Design Spectral Response Acceleration at 0.2 s Period, S_{DS}	1.06 g
Design Spectral Response Acceleration at 1.0 s Period, S_{D1}	0.54 g

Note:

a. The 2010 CBC parameters are based on the ASCE 7-5 Standard/2009 International Building Code which makes use of the 2002 USGS hazard data.

Table 2. 2013 CBC Seismic Parameters
Vine Substation
San Diego, California

Parameter [b]	Value
Site Soil Class	C
Mapped Spectral Response Acceleration at 0.2 s Period, S_S	1.23 g
Mapped Spectral Response Acceleration at 1.0 s Period, S_1	0.48 g
Short Period Site Coefficient at 0.2 s Period, F_a	1.00
Long Period Site Coefficient at 1.0 s Period, F_v	1.32
Adjusted Spectral Response Acceleration at 0.2 s Period, S_{MS}	1.23 g
Adjusted Spectral Response Acceleration at 1.0 s Period, S_{M1}	0.63 g
Design Spectral Response Acceleration at 0.2 s Period, S_{DS}	0.82 g
Design Spectral Response Acceleration at 1.0 s Period, S_{D1}	0.42 g

Note:

b. The 2013 CBC parameters are based on the ASCE 7-10 Standard/2012 International Building Code which makes use of the 2008 USGS hazard data.

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

Summary and Conclusions

This letter report presents the results of the seismic evaluations performed by Geosyntec to support planning, design, and construction of the proposed Vine Substation project in San Diego, California. The ultimate objectives of these evaluations were: (i) assessment of soil liquefaction potential at the site; (ii) evaluation of soil liquefaction impacts, if any; and (iii) development of seismic parameters for structural design.

The results of seismic evaluations documented herein indicate that the design earthquake is an event with 2 percent PE in 50 years (2,475-year return period). The design earthquake magnitude corresponding to this design event is **M**6.64. The design (bedrock) PHGA is 0.56 g. The controlling fault is the RCFZ.

The results of seismic evaluations documented herein further indicate that relatively thin and isolated lenses of saturated sandy soil may liquefy in design earthquake. However, the impact of soil liquefaction on overall site response is relatively small and manifests itself primarily through soil liquefaction-induced settlements that are on the order of 1 inch. While the average magnitude of liquefaction-induced settlement is relatively small, soil liquefaction may induce drag loads and downdrag settlement on deep foundations. Therefore, design of deep foundations should include additional downdrag loads in the top 60 feet of the site profile.

LIMITATIONS

It should be recognized that the data, conclusions, and recommendations contained in this report are partially based on information provided and work conducted by others. Geosyntec is not responsible for circumstances resulting from errors, omissions, and inaccuracies in the information and work performed by others.

Geosyntec is not responsible for the use of the data or conclusions presented in this report for any purposes other than the specific purposes expressed herein. If you have any questions regarding this report or require additional information, please do not hesitate to contact either of the undersigned.

CLOSURE

This letter report was prepared in accordance with general standards of engineering practice existing in southern California at the time of preparation of this report. In

Geosyntec consultants

accordance with the peer review policy of the firm, this letter report was reviewed by Steven Fitzwilliam, P.E., G.E., of Geosyntec.

Sincerely,

Zahra A. Amini, Ph.D.
Senior Staff Engineer

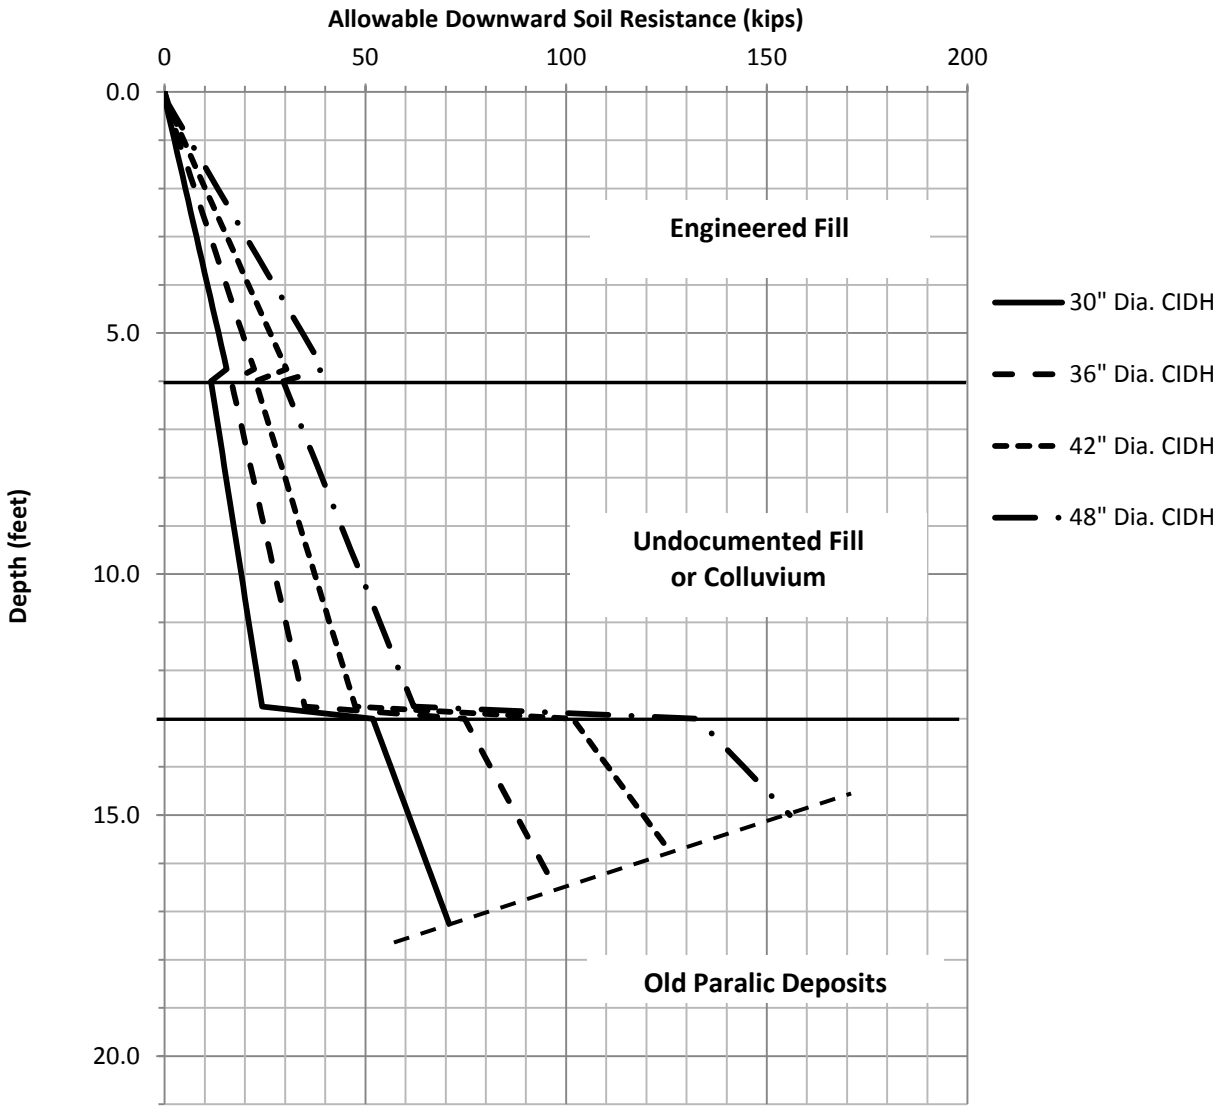
APPENDIX F

Preliminary Deep Foundation Analyses

Axial Resistance and Drag Load



Notes:

a. Simplified stratigraphy assumes 5' of overexcavation and recompaction, 1' of engineered fill placed above existing grade, and top of Old Paralic Deposits 13 feet below finish grade.

b. Resistance values terminated at maximum recommended foundation depth of 1.5*CIDH diameters above design high groundwater (20' + 1' below assumed finished grade).

Problem Title

Project Name: Vine Substation

Job Number: SC0368 30

Client: SDG&E

Engineer: JLN

Description: Simplified Sand Profile

Program Options

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes pile response to lateral loading and will compute nonlinear moment-curvature and nominal moment capacity for section types with nonlinear properties.

Computation Options:
- Analysis does not use p-y multipliers (individual pile or shaft only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix values
- Report pile response for full length of pile
- Analysis assumes no loading by soil movements acting on pile
- No p-y curves to be computed and reported for user-specified depths

Solution Control Parameters:
- Number of pile increments = 84
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 14.00 ft

Depth of ground surface below top of pile = 0.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	48.0000000
2	14.000000	48.0000000

Input Structural Properties:

Pile Section No. 1:

Section Type	= Drilled Shaft (Bored Pile)
Section Length	= 14.00000000 ft
Section Diameter	= 48.00000000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 0.0000 ft
Distance from top of pile to bottom of layer	= 1.00000 ft
Effective unit weight at top of layer	= 130.00000 pcf
Effective unit weight at bottom of layer	= 130.00000 pcf
Friction angle at top of layer	= 40.00000 deg.
Friction angle at bottom of layer	= 40.00000 deg.
Subgrade k at top of layer	= 225.00000 pci
Subgrade k at bottom of layer	= 225.00000 pci

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 1.00000 ft
Distance from top of pile to bottom of layer	= 6.00000 ft
Effective unit weight at top of layer	= 120.00000 pcf
Effective unit weight at bottom of layer	= 120.00000 pcf
Friction angle at top of layer	= 32.00000 deg.
Friction angle at bottom of layer	= 32.00000 deg.
Subgrade k at top of layer	= 60.00000 pci
Subgrade k at bottom of layer	= 60.00000 pci

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 6.00000 ft
Distance from top of pile to bottom of layer	= 13.00000 ft
Effective unit weight at top of layer	= 115.00000 pcf
Effective unit weight at bottom of layer	= 115.00000 pcf
Friction angle at top of layer	= 30.00000 deg.
Friction angle at bottom of layer	= 30.00000 deg.
Subgrade k at top of layer	= 40.00000 pci
Subgrade k at bottom of layer	= 40.00000 pci

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	13.00000 ft
Distance from top of pile to bottom of layer	=	21.00000 ft
Effective unit weight at top of layer	=	130.00000 pcf
Effective unit weight at bottom of layer	=	130.00000 pcf
Friction angle at top of layer	=	34.00000 deg.
Friction angle at bottom of layer	=	34.00000 deg.
Subgrade k at top of layer	=	225.00000 pci
Subgrade k at bottom of layer	=	225.00000 pci

(Depth of lowest soil layer extends 7.00 ft below pile tip)

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	0.00	130.000	40.000	225.000
		1.000	130.000	40.000	225.000
2	Sand (Reese, et al.)	1.000	120.000	32.000	60.000
		6.000	120.000	32.000	60.000
3	Sand (Reese, et al.)	6.000	115.000	30.000	40.000
		13.000	115.000	30.000	40.000
4	Sand (Reese, et al.)	13.000	130.000	34.000	225.000
		21.000	130.000	34.000	225.000

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 2

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	1	V = 18.60000 lbs	M = 0.0000 in-lbs	86.00000000	No
2	1	V = 38.80000 lbs	M = 0.0000 in-lbs	86.00000000	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Drilled Shaft (Bored Pile):

Length of Section	=	14.00000000 ft
Shaft Diameter	=	48.00000000 in
Concrete Cover Thickness	=	3.00000000 in
Number of Reinforcing Bars	=	14 bars
Yield Stress of Reinforcing Bars	=	60.00000000 ksi
Modulus of Elasticity of Reinforcing Bars	=	29000. ksi
Gross Area of Shaft	=	1809.55736847 sq. in.
Total Area of Reinforcing Steel	=	17.78000000 sq. in.
Area Ratio of Steel Reinforcement	=	0.98 percent
Edge-to-Edge Bar Spacing	=	7.79327764 in
Maximum Concrete Aggregate Size	=	1.00000000 in
Ratio of Bar Spacing to Aggregate Size	=	7.79
Offset of Rebar Cage Center from Center of Pile	=	0.0000000 in

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As = 5635.832 kips
Tensile Load for Cracking of Concrete = -708.453 kips
Nominal Axial Tensile Capacity = -1066.800 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	1.27000	1.27000	20.36500	0.00000
2	1.27000	1.27000	18.34823	8.83604
3	1.27000	1.27000	12.69737	15.92200
4	1.27000	1.27000	4.53164	19.85441
5	1.27000	1.27000	-4.53164	19.85441
6	1.27000	1.27000	-12.69737	15.92200
7	1.27000	1.27000	-18.34823	8.83604
8	1.27000	1.27000	-20.36500	0.00000
9	1.27000	1.27000	-18.34823	-8.83604
10	1.27000	1.27000	-12.69737	-15.92200
11	1.27000	1.27000	-4.53164	-19.85441
12	1.27000	1.27000	4.53164	-19.85441
13	1.27000	1.27000	12.69737	-15.92200
14	1.27000	1.27000	18.34823	-8.83604

NOTE: The positions of the above rebars were computed by LPile

Minimum spacing between any two bars not equal to zero = 7.79328 inches between Bars 5 and 6

Spacing to aggregate size ratio = 7.79328

Concrete Properties:

Compressive Strength of Concrete = 3.00000000 ksi
Modulus of Elasticity of Concrete = 3122.01857778 ksi
Modulus of Rupture of Concrete = -0.41079191 ksi
Compression Strain at Peak Stress = 0.00163356
Tensile Strain at Fracture of Concrete = -0.00011596
Maximum Coarse Aggregate Size = 1.00000000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.086

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 0.086 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in	Max Concrete Stress ksi	Max Steel Stress ksi	Run Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	0.086	19710.359	0.00300000

Note note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318-08, Section
9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding
bending stiffnesses computed for common resistance factor values used for
reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in^2
1	0.65	19710.359	0.056	12811.733	218062720.509
1	0.70	19710.359	0.060	13797.251	217419207.200
1	0.75	19710.359	0.065	14782.769	212976624.644

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 18.600 lbs
Applied moment at pile head = 0.000 in-lbs
Axial thrust load on pile head = 86.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial and bending stress in elastic
  sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.0001691 inches
Computed slope at pile head      =   -0.000001232 radians
Maximum bending moment           =    755.1063185 inch-lbs
Maximum shear force              =     18.6000000 lbs
Depth of maximum bending moment  =     70.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =              6
Number of zero deflection points =              1
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 38.800 lbs
Applied moment at pile head = 0.000 in-lbs
Axial thrust load on pile head = 86.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial and bending stress in elastic
  sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.0003528 inches
Computed slope at pile head = -0.000002570 radians
Maximum bending moment = 1575.1680193 inch-lbs
Maximum shear force = 38.8000000 lbs
Depth of maximum bending moment = 70.0000000 inches below pile head
Depth of maximum shear force = 0.000000 inches below pile head
Number of iterations = 6
Number of zero deflection points = 1

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)		Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	1	V = 18.6000	M =	0.000	86.00000000	0.00016911	755.10631852	18.6000	-0.00000123

Problem Title

Project Name: Vine Substation

Job Number: SC0368 30

Client: SDG&E

Engineer: JLN

Description: Simplified Sand Profile

Program Options

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes pile response to lateral loading and will compute nonlinear moment-curvature and nominal moment capacity for section types with nonlinear properties.

Computation Options:
- Analysis does not use p-y multipliers (individual pile or shaft only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix values
- Report pile response for full length of pile
- Analysis assumes no loading by soil movements acting on pile
- No p-y curves to be computed and reported for user-specified depths

Solution Control Parameters:
- Number of pile increments = 100
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 13.00 ft

Depth of ground surface below top of pile = 0.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	30.0000000
2	13.000000	30.0000000

Input Structural Properties:

Pile Section No. 1:

Section Type	= Drilled Shaft (Bored Pile)
Section Length	= 13.00000000 ft
Section Diameter	= 30.00000000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 0.0000 ft
Distance from top of pile to bottom of layer	= 1.00000 ft
Effective unit weight at top of layer	= 130.00000 pcf
Effective unit weight at bottom of layer	= 130.00000 pcf
Friction angle at top of layer	= 40.00000 deg.
Friction angle at bottom of layer	= 40.00000 deg.
Subgrade k at top of layer	= 225.00000 pci
Subgrade k at bottom of layer	= 225.00000 pci

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 1.00000 ft
Distance from top of pile to bottom of layer	= 6.00000 ft
Effective unit weight at top of layer	= 120.00000 pcf
Effective unit weight at bottom of layer	= 120.00000 pcf
Friction angle at top of layer	= 32.00000 deg.
Friction angle at bottom of layer	= 32.00000 deg.
Subgrade k at top of layer	= 60.00000 pci
Subgrade k at bottom of layer	= 60.00000 pci

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	= 6.00000 ft
Distance from top of pile to bottom of layer	= 13.00000 ft
Effective unit weight at top of layer	= 115.00000 pcf
Effective unit weight at bottom of layer	= 115.00000 pcf
Friction angle at top of layer	= 30.00000 deg.
Friction angle at bottom of layer	= 30.00000 deg.
Subgrade k at top of layer	= 40.00000 pci
Subgrade k at bottom of layer	= 40.00000 pci

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	13.00000 ft
Distance from top of pile to bottom of layer	=	21.00000 ft
Effective unit weight at top of layer	=	130.00000 pcf
Effective unit weight at bottom of layer	=	130.00000 pcf
Friction angle at top of layer	=	34.00000 deg.
Friction angle at bottom of layer	=	34.00000 deg.
Subgrade k at top of layer	=	225.00000 pci
Subgrade k at bottom of layer	=	225.00000 pci

(Depth of lowest soil layer extends 8.00 ft below pile tip)

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	0.00	130.000	40.000	225.000
		1.000	130.000	40.000	225.000
2	Sand (Reese, et al.)	1.000	120.000	32.000	60.000
		6.000	120.000	32.000	60.000
3	Sand (Reese, et al.)	6.000	115.000	30.000	40.000
		13.000	115.000	30.000	40.000
4	Sand (Reese, et al.)	13.000	130.000	34.000	225.000
		21.000	130.000	34.000	225.000

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load No.	Load Type	Condition 1		Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	1	V = 2.50000 lbs	M =	0.0000 in-lbs	0.0000000	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Drilled Shaft (Bored Pile):

Length of Section	=	13.00000000 ft
Shaft Diameter	=	30.00000000 in
Concrete Cover Thickness	=	3.00000000 in
Number of Reinforcing Bars	=	9 bars
Yield Stress of Reinforcing Bars	=	60.00000000 ksi
Modulus of Elasticity of Reinforcing Bars	=	29000. ksi
Gross Area of Shaft	=	706.85834706 sq. in.
Total Area of Reinforcing Steel	=	3.96000000 sq. in.
Area Ratio of Steel Reinforcement	=	0.56 percent
Edge-to-Edge Bar Spacing	=	7.20196833 in
Maximum Concrete Aggregate Size	=	1.00000000 in
Ratio of Bar Spacing to Aggregate Size	=	7.20
Offset of Rebar Cage Center from Center of Pile	=	0.0000000 in

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As = 2029.991 kips
Tensile Load for Cracking of Concrete = -267.781 kips
Nominal Axial Tensile Capacity = -237.600 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	0.75000	0.44000	11.62500	0.00000
2	0.75000	0.44000	8.90527	7.47241
3	0.75000	0.44000	2.01866	11.44839
4	0.75000	0.44000	-5.81250	10.06755
5	0.75000	0.44000	-10.92393	3.97598
6	0.75000	0.44000	-10.92393	-3.97598
7	0.75000	0.44000	-5.81250	-10.06755
8	0.75000	0.44000	2.01866	-11.44839
9	0.75000	0.44000	8.90527	-7.47241

NOTE: The positions of the above rebars were computed by LPile

Minimum spacing between any two bars not equal to zero = 7.20197 inches between Bars 5 and 6

Spacing to aggregate size ratio = 7.20197

Concrete Properties:

Compressive Strength of Concrete = 3.00000000 ksi
Modulus of Elasticity of Concrete = 3122.01857778 ksi
Modulus of Rupture of Concrete = -0.41079191 ksi
Compression Strain at Peak Stress = 0.00163356
Tensile Strain at Fracture of Concrete = -0.00011596
Maximum Coarse Aggregate Size = 1.00000000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 0.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in	Max Concrete Stress ksi	Max Steel Stress ksi	Run Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	0.000	2836.399	0.00300000

Note note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in^2
1	0.65	2836.399	0.000	1843.659	19663458.991
1	0.70	2836.399	0.000	1985.479	19619623.964
1	0.75	2836.399	0.000	2127.299	19246641.352

Computed Values of Pile Loading and Deflection for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 2.500 lbs
Applied moment at pile head = 0.000 in-lbs
Axial thrust load on pile head = 0.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial and bending stress in elastic
  sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 1:

Pile-head deflection = 0.0000295 inches
Computed slope at pile head = -0.000000282 radians
Maximum bending moment = 83.8712488 inch-lbs
Maximum shear force = 2.5000000 lbs
Depth of maximum bending moment = 60.8400000 inches below pile head
Depth of maximum shear force = 0.000000 inches below pile head

Number of iterations = 6
Number of zero deflection points = 1

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	1	V = 2.5000	M = 0.000	0.0000000	0.00002953	83.87124884	2.5000	-0.00000028

The analysis ended normally.

4.7 GREENHOUSE GAS EMISSIONS

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			✓	
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?				✓

4.7.0 Introduction

This section of the Proponent's Environmental Assessment describes the existing conditions in the area of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and potential impacts relating to greenhouse gases (GHG) associated with the construction and operation of the Proposed Project. Construction may result in emissions of GHGs due to combustion of fossil fuels in construction equipment and vehicles. However, the Proposed Project will not generate GHG emissions, either directly or indirectly, that would have a significant impact on the environment or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing emissions of GHGs.

4.7.1 Methodology

Federal, state, and regional/local regulations and policies were consulted to determine the Proposed Project's level of compliance with, as well as potential impacts to, applicable climate action plans and/or GHG standards. Information for this section was obtained from Internet searches of federal, state, and regional/local websites. The simulated GHG emissions presented in this section were developed using the South Coast Air Quality Management District's (SCAQMD's) California Emissions Estimator Model (CalEEMod). The analysis of GHG emissions evaluates the Proposed Project's potential to generate GHG emissions for the construction and operational phases of the Proposed Project. GHG emissions were calculated with the intent of identifying the biggest contributors of GHGs.

4.7.2 Existing Conditions

Global climate change refers to changes in average climatic conditions on Earth as a whole, including temperature, wind patterns, precipitation, and storms. Global temperatures are moderated by naturally occurring atmospheric gases, including water vapor, carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), which are known as GHGs. These gases allow solar radiation (i.e., sunlight) into Earth's atmosphere, but prevent radiative heat from escaping, thus warming Earth's atmosphere.

Gases that trap heat in the atmosphere are often called GHGs, analogous to a greenhouse. GHGs are emitted by both natural processes and human activities. The accumulation of GHGs in the atmosphere regulates Earth's temperature. Emissions from human activities, such as burning fossil fuels for electricity production and vehicle use, have elevated the concentration of these gases in the atmosphere.

The proposed Vine Substation site is currently used as a long-term airport parking lot and is not currently a source of GHG emissions. The relocated and new distribution circuits, 69 kV loop-in, and telecommunication system extension will be constructed in existing power line corridors or in City of San Diego streets that are not existing sources of GHG emissions.

Different GHGs have varying global warming potentials. Global warming potential is the effectiveness of a gas or aerosol to trap heat in the atmosphere. According to the United States (U.S.) Environmental Protection Agency (EPA), global warming potential is the "cumulative radiative forcing effect of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas." The reference gas for global warming potential is CO_2; therefore, CO_2 has a global warming potential of 1. The other main GHGs that have been attributed to human activity are CH_4, which has a global warming potential of 21; and N_2O, which has a global warming potential of 310. Table 4.7-1: Global Warming Potentials and Atmospheric Lifetimes of GHGs presents the global warming potential and atmospheric lifetimes of common GHGs.

Table 4.7-1: Global Warming Potentials and Atmospheric Lifetimes of GHGs

GHG	Formula	100-Year Global Warming Potential	Atmospheric Lifetime (years)
Carbon Dioxide	CO_2	1	Variable
Methane	CH_4	21	12 ± 3
Nitrous Oxide	N_2O	310	120
Sulfur Hexafluoride	SF_6	23,900	3,200

In the California Greenhouse Gas Emission Inventory, the California Air Resources Board (CARB) compiled statewide anthropogenic GHG emissions and sinks, which include processes that uptake GHG emissions. The inventory includes estimates for CO_2, CH_4, N_2O, sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs). The current inventory covers 1990 through 2008, and is summarized in Table 4.7-2: State of California Greenhouse Gas Emissions by Sector. Data sources used to calculate this GHG inventory include California and federal agencies, international organizations, and industry associations. Calculation methodologies applied are consistent with guidance from the Intergovernmental Panel on Climate Change. The 1990 emissions level is the sum total of sources and sinks from all sectors and categories in the inventory. CARB's original inventory was divided into seven broad sectors and categories: agriculture, commercial, electricity generation, forestry, industrial, residential, and transportation. The latest inventory includes GHG emissions from recycling and waste management, high global warming potential gas emissions, and reductions in GHG emissions related to forestry (i.e., forestry sinks).

Table 4.7-2: State of California Greenhouse Gas Emissions by Sector

Sector	Total 1990 Emissions ($MMTCO_2e$)[1]	Percent of Total 1990 Emissions	Total 2008 Emissions ($MMTCO_2e$)	Percent of Total 2008 Emissions
Agriculture	23.4	5	28.1	6
Commercial	14.4	3	14.7	3
Electricity Generation	110.6	26	116.4	25
Forestry (excluding sinks)	0.2	< 1	0.2	< 1
Industrial	103.0	24	92.66	20
Residential	29.7	7	28.5	6
Transportation	150.7	35	175.0	37
Recycling and Waste Management	--	--	6.7	1
High Global Warming Potential Gas Emissions	--	--	15.65	3
Forestry Sinks	(6.7)	--	(3.98)	--

Regulatory Background

Federal

Endangerment Finding

On April 17, 2009, the EPA issued its proposed endangerment finding for GHG emissions. On December 7, 2009, the EPA Administrator signed the following two distinct findings regarding GHGs under Section 202(a) of the Clean Air Act:

- Endangerment Finding: The EPA found that the current and projected concentrations of the six key well-mixed GHGs—CO_2, CH_4, N_2O, SF_6, HFCs, and PFCs—in the atmosphere threaten the public health and welfare of current and future generations.

- Cause or Contribute Finding: The EPA found that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to GHG pollution, which threatens public health and welfare.

The endangerment findings do not themselves impose any requirements on industry or other entities. However, this action is a prerequisite to finalizing the EPA's proposed GHG emissions standards for light-duty vehicles, which were jointly proposed by the EPA and the U.S.

[1] $MMTCO_2e$ refers to million metric tons of CO_2 equivalent emissions.

Department of Transportation's National Highway Safety Administration on September 15, 2009.

Mandatory Reporting of Greenhouse Gases, Title 40, Part 98 of the Code of Federal Regulations

The EPA's rule titled Mandatory Reporting of Greenhouse Gases (Title 40, Part 98 of the Code of Federal Regulations) requires mandatory reporting of GHGs for certain facilities. Subpart DD of the rule, titled Electrical Transmission and Distribution Equipment Use, applies to SF_6 reporting from gas-insulated substations. The proposed Vine Substation will be an air-insulated substation, rather than a gas-insulated substation.

Under the final Mandatory Reporting Rule for Additional Sources of Fluorinated GHGs, owners and operators of electric power system facilities with a total nameplate capacity that exceeds 17,820 pounds (7,838 kilograms) of SF_6 and/or PFCs must report emissions of SF_6 and/or PFCs from the use of electrical transmission and distribution equipment. Owners or operators must collect emissions data; calculate GHG emissions; and follow the specified procedures for quality assurance, missing data, recordkeeping, and reporting.

The rule requires each electric power system facility operator to report total SF_6 and PFC emissions (including emissions from equipment leaks, installation, servicing, decommissioning, and disposal, and from storage cylinders) from the following types of equipment:

- gas-insulated substations;
- circuit breakers;
- switchgears, including closed-pressure and hermetically sealed pressure switchgears;
- gas-insulated lines containing SF_6 or PFCs;
- gas containers, such as pressurized cylinders;
- gas carts;
- electric power transformers; and
- other containers of SF_6 or PFCs.

Because the proposed Vine Substation will be an air-insulated substation, only the Proposed Project's 69 kV circuit breakers will contain SF_6. Facilities subject to Subpart DD began monitoring GHG emissions on January 1, 2011, in accordance with the methods specified in Subpart DD. The deadline for reporting is March 31 of each year, unless that date falls on a weekend, in which case the report is due the next business day.

State

The most common GHGs that result from human activity, as defined by California Health and Safety Code Section 38505(g), are any of the following compounds: CO_2, CH_4, N_2O, SF_6, HFCs, or PFCs.

Assembly Bill 32, the California Global Warming Solutions Act of 2006

In September 2006, then-Governor Arnold Schwarzenegger signed California Assembly Bill (AB) 32, the Global Warming Solutions Act, into law. Pursuant to AB 32, CARB adopted a comprehensive AB 32 Scoping Plan in December 2008, which outlined programs designed to

achieve the 2020 GHG reduction goal of 174 MMTCO$_2$e through regulations, market mechanisms, and other actions.

For the electricity sector, the scoping plan adopted the California Public Utilities Commission's (CPUC's) recommendations for investor-owned and publicly owned utilities to continue and increase implementation of programs designed to reduce emissions. These recommendations included energy efficiency programs, increasing the use of electricity supplies obtained from renewable generation sources to 33 percent by 2020, and the adoption of a cap and trade system to ensure an overall reduction of emissions from electric generation.

The AB 32 Scoping Plan Measure H-6 led to CARB's Regulation for Reducing Sulfur Hexafluoride Emissions from Gas Insulated Switchgear (Title 17, Sections 95350 to 95359 of the California Code of Regulations). The proposed Vine Substation will be an air-insulated substation, rather than a gas-insulated substation.

Therefore, the 69 kV circuit breakers will be the only equipment containing SF_6. CARB's SF_6 regulation sets the maximum emissions rate for SF_6-containing equipment at 10 percent by 2011. The maximum allowable emissions rate decreases by 1 percent each year. In 2020, the threshold will remain at 1 percent.

State Standards Addressing Vehicular Emissions

California AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light-duty trucks. CARB adopted the regulations on September 24, 2009, to reduce GHG emissions in new passenger vehicles from 2009 through 2016. CARB has estimated that the regulations will reduce emissions from the light-duty passenger vehicle fleet by an estimated 18 percent in 2020 and by 27 percent in 2030.

Senate Bills 1078 and 107 and Executive Order S-14-08

Senate Bill (SB) 1078 requires retail sellers of electricity to provide at least 20 percent of their supply from renewable sources by 2017. SB 107 changed the target date to 2010. In November 2008, then-Governor Arnold Schwarzenegger signed Executive Order S-14-08, which expands the Renewables Energy Standard to 33 percent by 2020. In April 2011, the California Legislature enacted SB 2, which mandates the Renewables Portfolio Standard of 33 percent by 2020 for investor-owned and publicly owned utilities.

Executive Order S-21-09

Executive Order S-21-09 directs CARB to work with the CPUC and the California Energy Commission (CEC) to implement the Renewables Portfolio Standard of 33 percent by 2020. On May 5, 2011, the CPUC adopted Order Instituting Rulemaking 11-05-005 to open a new proceeding for the Renewables Portfolio Standard.

CARB is also working with the California Independent System Operator and other load balancing authorities to address reliability, renewable integration requirements, and interactions with wholesale power markets. CARB established a "loading order" in its Energy Action Plan for resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health.

SDG&E Programs

SDG&E has been engaged for many years in activities to reduce GHG emissions. These activities include programs to increase energy efficiency and efforts to meet the Renewables Portfolio Standard of 33 percent of its supply from renewable sources by 2020. In 2011, 20.8 percent of SDG&E's retail sales were from renewable energy sources.

SDG&E submits a mandatory Long-Term Procurement Plan (LTPP) to the CPUC that describes its strategy for meeting the forecasted load during the next 10 years. The LTPP must be consistent with the "loading order" prescribed in the Energy Action Plan to meet growth first with conservation, then with renewable sources of electricity, and finally with new fossil fuel sources to the extent necessary. New generation sources must be consistent with the LTPP. The CPUC approved SDG&E's most recent LTPP in September 2008.

The LTPP includes the following programs to reduce GHG emissions:

- energy efficiency, which will reduce needed capacity by 487 megawatts (MW) by 2016;
- demand response, which will reduce needed capacity by 249 MW by 2016;
- renewables, which will provide 318 MW in 2010 and 727 MW in 2016; and
- new peaker plants to back up intermittent renewables and support retirement of older plants.

Forecasted reductions from these programs are greater than 1.5 $MMTCO_2e$ per year. These efforts will reduce carbon intensity by one-third while accommodating continued population growth, and will ensure consistency with the applicable plans, policies, and regulations adopted by California to reduce GHG emissions.

4.7.3 Impacts

Significance Criteria

Standards for determining impact significance were derived from Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Under these guidelines, impacts to GHGs would be considered significant if the Proposed Project:

- Generates GHG emissions, either directly or indirectly, that may have a significant impact on the environment
- Conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG

The San Diego County Air Pollution Control District (SDAPCD) has not established GHG thresholds under CEQA. The SCAQMD has adopted and the County of San Diego Planning & Development Services has issued a significance threshold of 10,000 metric tons (MT) of CO_2e emissions annually for industrial sources, below which levels an industrial project would not generate GHG emissions that would have a significant impact on the environment. The SCAQMD and the County of San Diego recommend amortizing construction emissions over a 30-year period to account for their contribution to GHG emissions over the lifetime of the Proposed Project.

Question 4.7a – Greenhouse Gas Emissions

Construction – Less-than-Significant Impact

The main source of GHG emissions associated with the Proposed Project will be fossil fuel combustion during construction. GHG emissions for construction were calculated using the same approach as criteria pollutant emissions for overall construction emissions. Estimated GHG emissions are summarized in Table 4.7-3: Greenhouse Gas Construction Emissions.

Table 4.7-3: Greenhouse Gas Construction Emissions

Category	GHG Emissions (metric tons)		
	CO_2	CH_4	N_2O
Total Construction Emissions	1,921.13	0.46	0.00
Global Warming Potential	1	21	310
CO_2 Equivalent	1,921.13	9.66	0.00
Total CO_2 Equivalent	1,930.79		
Amortized Construction Emissions (Amortized over 30 Years)	64.36		

The SCAQMD has adopted and the County of San Diego Planning & Development Services has issued a significance threshold of 10,000 MT of CO_2e emissions annually for industrial sources. The Proposed Project's total annualized construction CO_2e emissions of 64.36 MT, will be below the significance threshold of 10,000 MT of CO_2e emissions annually. This level of GHG emissions will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Operation and maintenance activities will include regular inspection of the substation, distribution circuits, and power line and periodic maintenance activities. These activities will generate a minor amount of GHG emissions from vehicles and/or equipment used to inspect and maintain the facilities. GHG emissions associated with operation and maintenance will be well below the applicable significance thresholds.

Equipment that contains SF_6 has the potential to contribute to GHG emissions during operation and maintenance of the Proposed Project. The proposed Vine Substation will be an air-insulated substation, rather than a gas-insulated substation. Therefore, the Proposed Project's 69 kV circuit breakers will be the only piece of equipment containing SF_6. Under the ultimate arrangement, the proposed Vine Substation will have nine 69 kV circuit breakers containing SF_6. Each circuit breaker is estimated to hold 33 pounds of SF_6. The Proposed Project will accordingly use a total of 297 pounds of SF_6.

New SF_6 equipment, including the Proposed Project's 69 kV circuit breakers, has a low leak rate of approximately 0.1 percent annually per industry standards. The Proposed Project will include design and operational features to maintain the SF_6 emissions rate at approximately 0.1 percent,

which is well below the maximum allowable SF_6 emissions rate of one percent that CARB has established for 2020. With a leak rate of 0.1 percent annually, the Proposed Project will emit approximately 0.297 pound of SF_6. Because SF_6 has a global warming potential of 23,900, the Proposed Project's 69 kV circuit breakers will have an annual emission of approximately 7,098.30 pounds (3.22 MT) of CO_2e for operations and maintenance. As shown in Table 4.7-4: Greenhouse Gas Operation and Maintenance Emissions, when added to the amortized construction emissions and simulated emissions from the use of construction equipment and vehicles during operation and maintenance activities, the total annual emissions are anticipated to be approximately 68.04 MT of CO_2e. This level falls below the SCAQMD's and the County of San Diego's significance threshold of 10,000 MT of CO_2e emissions annually for industrial sources. Accordingly, impacts will be less than significant.

Table 4.7-4: Greenhouse Gas Operation and Maintenance Emissions

Source	GHG Emissions (metric tons of CO_2e per year)
Off-Road Equipment and On-Road Vehicle Use	0.46
Fugitive Circuit Breaker Emissions	3.22
Amortized Construction Emissions	64.36
Total	**68.04**

Question 4.7b – Applicable Greenhouse Gas Plan Conflicts

Construction – No Impact

The Proposed Project's GHG emissions from construction will be below the significance threshold when amortized over a 30-year period, as recommended by the SCAQMD and the County of San Diego. Equipment and vehicles supporting construction of the Proposed Project will comply with the requirements implemented by CARB to reduce GHG emissions and will be consistent with AB 32's goals. Accordingly, there will be no impact associated with construction.

Operation and Maintenance – No Impact

The proposed Vine Substation will be air insulated; therefore, the substation's circuit breakers will be the only equipment containing SF_6. SDG&E has ongoing standard internal programs and practices that ensure compliance with the applicable SF_6 regulations and air quality plan, and those programs and practices will not change as a result of the Proposed Project. By virtue of its compliance with applicable rules and regulations and its similarity to existing operation and maintenance requirements, the Proposed Project will be consistent with AB 32's goals. Emissions will not differ from emission levels for operations and maintenance under existing rules and regulations. Accordingly, no impact will occur.

By complying with applicable rules and regulations and following SDG&E's design and operational features to decrease GHG emissions, the Proposed Project will not conflict with any

applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. Accordingly, there will be no impact.

4.7.4 Applicant-Proposed Measures

With implementation of SDG&E's ordinary construction/operating restrictions, potential impacts related to GHG, including SF_6, will remain less than significant. As a result, no applicant-proposed measures have been proposed.

4.8 HAZARDS AND HAZARDOUS MATERIALS

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			✓	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			✓	
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			✓	
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment?			✓	
e) If located within an airport land use plan or within two miles of a public airport or public use airport for which such a plan has not been adopted, result in a safety hazard for people residing or working in the project area?			✓	
f) If located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				✓
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			✓	

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fire, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				✓

4.8.0 Introduction

The purpose of this section is to document existing hazardous conditions in the area of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and to assess potential impacts that may occur as a result of implementation of the Proposed Project. Potential impacts include exposure to hazardous materials in or around the areas affected by the Proposed Project or exposure to hazards generated by the Proposed Project during the short-term construction phase and/or long-term operation. In addition, this section evaluates the hazards related to wildfire and exposure to potentially contaminated groundwater.

4.8.1 Methodology

A Phase I Environmental Site Assessment (ESA), included as Attachment 4.8-A: Phase I Environmental Site Assessment, was prepared by Geosyntec Consultants for the Proposed Project site in April 2014. The Phase I assessment and hazards assessment included a review of the following:

- federal and state databases to identify properties that may be listed in the referenced agency records and located within recommended American Society of Testing and Materials (ASTM) distances;
- available physiographic information including topographic, geologic, and hydrogeologic information;
- select historic aerial photographs to assess past usage of the site and surrounding areas;
- historic fire insurance maps;
- the Preliminary Geotechnical and Geologic Hazards Investigation for the proposed Vine Substation (Geosyntec Consultants, December 2013) included as Attachment 4.6-A: Preliminary Geotechnical and Geologic Hazards Investigation;
- site reconnaissance surveys; and

- reports summarizing previous hazardous materials investigations to understand existing site conditions.

Searches for known hazardous materials sites in the vicinity of the Proposed Project area were conducted via the Internet across federal, state, and local hazardous materials databases and as part of the Phase I ESA. In addition, emergency evacuation and response plans employed by the City of San Diego (City) and emergency measures implemented by the County of San Diego's Office of Emergency Services (OES) were researched. The City General Plan was also reviewed for relevant policies, plans, and programs pertaining to hazards and hazardous materials.

Records Review

A database search report was obtained from Environmental Data Resources, Inc. (EDR), which is included in Attachment 4.8-A: Phase I Environmental Site Assessment. The report documents findings of various federal, state, and local regulatory database searches regarding properties with known or suspected releases of hazardous materials or petroleum hydrocarbons. The following federal, state, and local records were reviewed, among others, to determine areas where contamination might be encountered during construction:

- Annual Workplan Sites
- California Hazardous Material Incident Report System
- Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS)
- CERCLIS No Further Response Actions Planned
- Department of Toxic Substances Control (DTSC) Cortese List
- Emergency Response Notification System
- Federal Emergency Response Notification System
- Federal Institutional Controls/Engineering Controls
- Federal Underground Storage Tank listings
- Local Landfill/Solid Waste Disposal sites
- Local Brownfield sites
- National Priorities List (NPL) (included delisted and proposed sites)
- Needing Further Evaluation sites
- Notify 65
- Resource Conservation and Recovery Act (RCRA) Corrective Action Report (CORRACTS) Treatment, Storage, Disposal Facilities (TSD) facilities
- RCRA non-CORRACTS TSD facilities
- RCRA generators
- School Property Evaluation Program
- State and Tribal Equivalent NPL/CERCLIS sites
- State and Tribal Registered Underground Storage Tanks
- State and Tribal Landfills and Solid Waste Disposal sites
- State and Tribal Leaking Underground Storage Tanks
- State and Tribal Voluntary Cleanup sites
- State Response sites

- Statewide Spills, Leaks, Investigations, and Cleanups
- Toxic Alert for California Superfund sites

A review of the databases identified properties located within the recommended ASTM distances from the Proposed Project. This review identified hazardous materials and the use, generation, storage, treatment, or disposal of chemicals, as well as any release incidents of such materials that may be encountered by the Proposed Project.

Historical Use

Aerial photographs, city directories, and topographic maps were reviewed, where available, to assess historical site and adjacent property uses, and the potential for encountering hazardous materials in the Proposed Project area as a result of historical use.

A Preliminary Geotechnical and Geologic Hazards Investigation was conducted by Geosyntec Consultants (Geosyntec) in December 2013 and included a review of published regional geologic information, review of previous site geotechnical information, site reconnaissance, geotechnical borings, cone penetration test soundings, and geotechnical laboratory testing. The investigation results reported that the northeastern portion of the site was previously occupied by a gas station, and the fuel reservoir had been removed. The Phase I ESA confirmed the previous use of a portion of the proposed Vine Substation site as a gas station and automotive repair service in the years 1969 and 1970 through research of historic aerial, Sanborn, and topographic maps. Historic city directories indicate the site included a service station as early as 1927; but historic maps do not confirm the existence of a service station at the site during that time period. There are no records to indicate environmental closure of the gas station, tank removal, or soil conditions. Geosyntec screened soil samples in the field for potential indications of contamination using geotechnical borings and a Photoionization Detector, and no volatile organic compounds or other soil vapors from the site soil samples were observed. Therefore, Geosyntec determined the potential for previous release of petroleum products to be insignificant.

Site Reconnaissance

In addition to the survey conducted for the Prelimary Geotechnical and Geologic Hazards Investigation and Phase 1 ESA site reconnaissance, a reconnaissance-level survey of the proposed Vine Substation site was conducted by Insignia Environmental on December 10, 2013. The reconnaissance survey consisted of walking the accessible areas of the property and conducting a visual examination for evidence of potential environmental concerns, which included the following:

- soil and groundwater contamination, as indicated by soil or pavement staining/discoloration;
- stressed vegetation;
- indications of waste-dumping or burial;
- pits;
- ponds or lagoons;
- containers of hazardous substances or petroleum products;

- electrical and hydraulic equipment, such as electrical transformers and hydraulic hoists, that may contain polychlorinated biphenyls (PCBs); and
- underground and aboveground storage tanks.

Insignia also observed adjoining property conditions from the site boundaries and public roadways for potential impacts that could affect the Proposed Project site.

4.8.2 Existing Conditions

The following discussion addresses the potential types and amounts of hazardous materials that are anticipated to be located within approximately one mile of the areas affected by the Proposed Project. Schools located within 0.25 mile of the Proposed Project have been identified according to California Environmental Quality Act (CEQA) requirements to assess potential impacts with regard to hazardous conditions. As the Proposed Project site is located within a highly urbanized area of the City of San Diego with established commercial and light industrial uses, the potential for hazardous materials contamination due to present or historic land uses does exist.

Regulatory Background

The following sections describe federal, state, local regulations regarding hazards and hazardous materials that apply to the Proposed Project.

Federal

United States Environmental Protection Agency

The United States (U.S.) Environmental Protection Agency (EPA) maintains a list of materials considered to be hazardous to the environment or to human health. These materials are identified in the following three categories:

- F-List: Wastes from the F-list are published under Title 40 of the Code of Federal Regulations (CFR) Section 261.31. These wastes include non-specific source wastes common in manufacturing and industrial processes.

- K-List: K-list wastes are published under 40 CFR § 261.32. These wastes include source-specific wastes from specific industries, including pesticide manufacturing and petroleum refining.

- P-List and U-List: Wastes from the P- and U-lists are published under 40 CFR § 261.33. These wastes include discarded commercial chemical products in an unused form.

Waste that has not been previously listed may still be considered hazardous if it exhibits one or more of the following characteristics: ignitibility, corrosivity, reactivity, or toxicity (40 CFR 261 Subpart C).

Uniform Building Code and Uniform Fire Code

The Uniform Building Code (UBC) and the Uniform Fire Code (UFC) provide codes for fire protection at the federal level. To minimize potential fire risk and damage to structures, the UBC provides requirements to which building construction, materials, and other elements or

construction practices must adhere. In addition, the UFC provides design measures for installation of fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards and safety measures, hazardous material storage and use, and other general and specialized requirements pertaining to fire safety and prevention.

Resource Conservation and Recovery Act

RCRA regulates potential health and environmental problems associated with hazardous and non-hazardous waste. This law is implemented by the U.S. EPA through Subtitle C, Title 42 of the U.S. Code (U.S.C.) Section 6921 et. seq., and its implementing regulations (40 CFR § 260 et seq.). The generation, transportation, treatment, storage, and disposal of hazardous waste is regulated through Subtitle C of the RCRA, which addresses a "cradle-to-grave" approach to hazardous waste management. All states are subject to Subtitle C with regard to hazardous waste generation. RCRA also provides the specific quantities of wastes that are regulated under the Act.

Comprehensive Environmental Response, Compensation, and Liability Act and Superfund Amendments and Reauthorization Act

CERCLA and SARA, together with their implementing regulations, govern the use, planning, reporting, clean up, and notification with regard to hazardous materials and hazardous material releases into the environment. These statutes are codified in 40 CFR § 239 through 282 and the regulations are defined in 40 CFR § 302 through 355.

Annual reporting requirements associated with hazardous materials released into the environment are provided in 42 U.S.C. § 11023 and 40 CFR § 372.30. Reporting of both routine discharges and spill releases is required. In addition, Title III of SARA (identified as the Emergency Planning and Community Right-To-Know Act of 1986) requires that all states develop and implement local chemical emergency preparedness programs and make available information pertaining to hazardous materials that are used at facilities within local communities.

Clean Water Act/Clean Air Act

The Clean Water Act (CWA) provides measures governing the accidental release of hazardous materials to surface waters. Similarly, the Clean Air Act (CAA) provides measures aimed at preventing the accidental release of hazardous materials into the atmosphere.

Regulations implementing the CAA and governing hazardous materials emissions are provided in 40 CFR Part 68. Implementation of these regulations is intended to prevent the accidental release of hazardous materials into the environment.

State

Division of Occupational Safety and Health

The California Occupational Safety and Health Act (Cal-OSHA) of 1970 provides measures to address the safety of construction and industrial workers. Title 8 of the California Code of Regulation (CCR) implements the majority of these measures. Cal-OSHA is responsible for enforcing the occupational and public safety laws adopted by the U.S. Department of Labor's Occupational Safety and Health Administration (OSHA). OSHA is responsible for the

regulation of workplace hazards and hazardous materials at the federal level, while Cal-OSHA regulates hazards and hazardous materials at the state level.

Department of Toxic Substances Control/California Environmental Protection Agency

DTSC regulates hazardous waste, cleans up existing contamination, and looks for ways to reduce the hazardous waste produced in California, while the California EPA is charged with developing, implementing, and enforcing the state's environmental protection laws.

Regional Water Quality Control Board

The San Diego Regional Water Quality Control Board (RWQCB) is responsible for protecting the beneficial uses of surface water and groundwater resources in the San Diego area. The RWQCB adopted a Water Quality Control Plan (Basin Plan) in September 1994 and amended the plan in April 2011. The Basin Plan sets forth implementation policies, goals, and water management practices in accordance with the Porter-Cologne Water Quality Control Act. The Basin Plan establishes both numerical and narrative standards and objectives for water quality aimed at protecting aquatic resources. Project discharges to surface waters in the region are subject to the regulatory standards set forth in the Basin Plan, which prevents the discharge of hazardous materials into waters of the U.S. Although groundwater is not used as a municipal or domestic water supply, the RWQCB enforces the provisions of the state statutes that protect groundwater.

California Hazardous Materials and Waste Codes

Within the State of California, the storage, handling, use, and/or disposal of hazardous materials is regulated through various sections of the California Health and Safety Code (H&SC). In addition, H&SC § 33437 requires lessees or purchasers of property in a redevelopment project to comply with all covenants, conditions, and restrictions imposed by the agency for the reasonable protection of lenders. Individual states are required by the RCRA to develop their own programs for the regulation of hazardous waste discharges; however, such plans are required to meet or exceed RCRA requirements.

The California Hazardous Waste Control Law (HWCL) addresses the control of hazardous wastes for the state. The HWCL regulates generators of universal waste (e.g., batteries, mercury control devices, dental amalgams, aerosol cans, and lamps/cathode ray tubes) under Section 25100 et seq. of the H&SC, as well as hydrocarbon waste (e.g., oils, lubricants, and greases) that is not classified as hazardous waste under the federal RCRA regulations. DTSC is responsible for the administration and enforcement of the HWCL.

The Hazardous Materials Release Response Plans and Inventory Act (H&SC, Section 25500 et seq.) and regulations provided in 19 CCR § 2620 et seq. require that local governments be responsible for the regulation of facilities that store, handle, or use hazardous materials above threshold quantities (TQs). The TQs for identified hazardous materials are 55 gallons for liquids, 500 pounds for solids, and 200 cubic feet for compressed gases measured at standard temperature and pressure. Facilities storing such hazardous materials in excess of their TQs are required to prepare a Hazardous Materials Business Plan (HMBP) to identify the facility's internal response requirements to accidental spills. The HMBP may identify emergency contacts, hazardous material inventory and quantities, control methods, emergency response

measures, and employee training methods. The HMBP is required to be submitted to the local administering agency, which is typically the local fire department or public health agency. In the event of a spill from such a facility, both the local administrative agency and the California Governor's OES must be notified.

H&SC Section 25249.5 et seq. of the Safe Drinking Water and Toxics Enforcement Act (i.e., Proposition 65) is administered through the California Office of Environmental Health Hazard Assessment. The Act regulates cancer-causing and reproduction-impairing chemicals. Under Proposition 65, users of such regulated chemicals are required to issue a public warning before potential exposure to chemicals above a threshold amount occurs (H&SC § 25249.6). In addition, the act is aimed at preventing discharges or releases of specified hazardous materials into a "source of drinking water." The Act provides a list of chemicals of concern (*Id.* § 25249.5), which is periodically updated.

Section 25404 et seq. of the California H&SC includes the California Unified Hazardous Waste and Hazardous Material Management Regulatory Program Act, which establishes specific requirements for handling hazardous waste locally by establishing the Certified Unified Program Agency (CUPA). The responsibility for management of local hazardous wastes is delegated by the California EPA to the local agency through a Memorandum of Understanding. The primary CUPA relative to the Proposed Project site is the County of San Diego's Department of Environmental Health Hazardous Materials Management Division (HMMD).

California Building Code

The California Building Code (CBC) provides design and construction measures for structures and other facilities with regard to fire protection and prevention. The CBC supplements the UBC by providing measures that are specific to potential conditions in the State of California. Measures provided in the CBC are integrated and enforced through city and county review of development projects, the Office of the State Fire Marshal, and by local city or county fire chiefs or marshals.

California Public Resources Code

The California Public Resources Code (PRC) provides regulations to enhance safety with regard to the operation and management of electrical transmission lines. These include, but are not limited to, the following:

- PRC Section 4292: This section requires the clearing of flammable vegetation around specific structures that support certain connectors or types of electrical apparatus. An approximately 10-foot radius around such structures must remain clear of vegetation for the entirety of the fire season.

- PRC Section 4293: This section requires specific clearance between conductors and vegetation. As the line voltage increases, the radius of clearance also increases. It is also required that some trees must be removed if they pose the potential to fall on an electrical transmission line and cause damage.

Local

San Diego County

Within San Diego County, the HMMD is responsible for the implementation of the CUPA. Hazardous materials are addressed through various county codes and regulations. The HMMD's hazardous material requirements include hazardous waste determination, storage and transportation of hazardous waste, treatment and disposal requirements, biennial reporting, emergency preparedness and prevention, emergency procedures, business plans, personnel training, and standards for violations. Regulations for the storage and use of explosives are provided in San Diego County General Regulation, Section 6904.

City of San Diego General Plan and Municipal Code

The Public Facilities, Services, and Safety Element of the City of San Diego General Plan addresses public facilities and services, such as fire and rescue, police, storm water protection, and disaster preparedness. The General Plan identifies goals and policies intended to allow for the efficient and adequate provision of public services and facilities, as well as to reduce the potential for hazardous or emergency situations to occur.

In addition, the Proposed Project site lies within the City's Airport Environs Overlay Zone, as designated in the City's Municipal Code. The Overlay Zone provides supplemental regulations for property surrounding the San Diego International Airport (SDIA), which is located approximately 0.75 mile to the southwest of the Proposed Project site. The Overlay Zone provides measures pertaining to land use compatibility, noise impacts, and safety hazards, among other issues.

San Diego County Regional Airport Authority Airport Land Use Compatibility Plan

The Proposed Project site is located approximately 0.75 mile northeast of the SDIA. The Airport Land Use Commission (ALUC) is required by federal and state law to create or update Airport Land Use Compatibility Plans (ALUCPs) for San Diego County's 16 public-use and military airports. The San Diego County Regional Airport Authority (SDCRAA) is in the process of updating the ALUCP for SDIA, which was originally adopted in 1992 and amended in 1994 and 2004. The July 2013 Draft ALUCP addresses airport compatibility issues related to noise, safety, airspace protection, and aircraft overflight. Local agencies are required to submit proposed actions to the ALUC for compatibility review until their General Plans are found to be consistent with the applicable ALUCP.

Contaminated Sites

To determine those sites that may potentially represent the greatest risk, the following were considered:

- Density of Listed Sites: The greater the number of listed sites in the vicinity of the Proposed Project, the greater the potential for encountering contamination.

- Type of Release and Medium Affected: Contaminants are typically transported at a faster rate in groundwater than in soil. The volume of contaminant released, release date, and

medium impacted all affect how contaminants may have migrated and, therefore, affects their potential to result in an impact.

Existing Hazardous Sites

Proposed Vine Substation and Transmission Line Corridor

A number of properties were identified with releases of hazardous substances or petroleum products within 0.50 mile of the Proposed Project, including the proposed Vine Substation and 12 kV distribution relocation sites. Five properties within one mile of the Proposed Project site were identified in RCRA CORRACTS or CERCLIS databases. Two of these properties are discussed in detail in the paragraphs that follow; a complete listing of sites identified in the Phase I ESA database search can be found in Attachment 4.8-A: Phase I Environmental Site Assessment.

The most notable of the sites identified, Honeywell International Inc. (Honeywell) (formerly Baron-Blakesee Inc.), is located at 3596 California Street, approximately 250 feet to the northwest of the proposed Vine Substation. The site is a former solvent recycling facility that accepted chlorinated and fluorinated solvents and processed the solvents by distillation to reclaim them as a usable product. Following cease of operations in 1993, several investigations identified significant concentrations of chlorinated hydrocarbons in soil, groundwater, and soil vapor at that property. In October 2008, the facility conducted a Soil Vapor Extraction pilot test to evaluate whether this technology will be effective at reducing the VOC concentrations in soil. The site's status is currently classified as active and undergoing closure. Based on reported soil vapor concentrations, a land use covenant was established to restrict the Honewell property from use as a residence, hospital, school, or other sensitive land uses.

The second site carried forward for discussion in the ESA is the Northside San Diego International Airport Redevelopment (formerly General Dynamics Facility), which is located approximately 950 feet from the Proposed Project site at 3302 Pacific Highway. Between 1935 and 1995, General Dynamics and its predecessors performed aircraft and aerospace manufacturing activities at the facility; facility decommissioning began in 1995 and ended in 1997. Chemicals of concern (COCs) used at the site included fuels, oils, solvents, acids, metals, and paints. In addition, PCB-bearing building materials were used. Prior to the facility decommissioning, COCs were found in the soil and groundwater, and several phases of investigations and remediation took place. During the facility decommissioning, additional remedial actions were taken, and recent soil and groundwater investigations also encountered COCs. As of November 2010, the SDCRAA has planned on redeveloping the site for airport-related businesses and is conducting additional investigations to assess the potential risk relative to the new site use. The site's status is classified as open and undergoing assessment. However, the site is located down gradient with ground water flow generally south to southwest, away from the Proposed Project site.

The following sections describe the types and amounts of hazardous materials likely to be present in the vicinity of the Proposed Project. All Proposed Project components are located in industrial areas, where historical land use may contribute to hazardous material contamination.

Contaminated Soil and Ground Water

No visual or olfactory indications of soil or groundwater contamination have been identified at the proposed Vine Substation site or the 12 kV distribution relocation and telecommunication system extension corridors. Groundwater is expected to be encountered at depths of between 24 and 25 feet below ground surface, as described further in Section 4.9 Hydrology and Water Quality.

Based on the Proposed Project site's designation with non-beneficial groundwater uses, many cases listed nearby the site have been closed with residual impacts in place. Three closed leaking UST facilities are located upgradient of the Proposed Project within 0.25 mile.

Fire Hazards

Based on the Wildland Fire Hazards Map depicted in the City of San Diego General Plan and California Department of Forestry and Fire Protection data, the Proposed Project is not located in a wildland fire hazard area. As of the date of the Phase I ESA, Geosyntec had not received responses from the Fire Department with regards to potential hazards.

Schools

One school is located within 0.25 mile of the Proposed Project—the Montessori School of San Diego—and it is approximately 0.25 mile southeast of the Proposed Project.

Airports

The Proposed Project site is located approximately 0.75 mile from the SDIA and, therefore, is required by state and local law to be consistent with the SDIA ALUCP. The July 2013 Draft SDIA ALUCP describes the noise, safety, airspace protection, and overflight policies and standards adopted to promote compatibility between the SDIA and surrounding future land uses. The July 2013 Draft SDIA ALUCP, once adopted, will supersede the previous ALUCP that was adopted in 1992 and amended in 1994 and 2004.

Emergency Response and Evacuation Plans

The County of San Diego's Office of Disaster Preparedness implements the San Diego County Operational Area Emergency Plan. The San Diego County Operational Area consists of the county, 18 cities (including the City of San Diego), and all special districts, including school districts. A formal Joint Powers relationship exists between the county and the 18 incorporated municipalities in the county. The Operational Area staff coordinates among all of the public agencies within the county's boundaries and the California Governor's OES. The Operational Area is staffed by the County of San Diego's OES. During a disaster response, the County of San Diego's OES is responsible for activating the county's Emergency Operations Center and coordinating resources at the Operational Area level, as well as collecting status reports and other information from organizations and facilities that may have sustained damage.

The San Diego County Operational Area Evacuation Annex (Annex) was designed to be used as a template for preparation of other jurisdictional evacuation plans and to supplement or support the evacuation plans developed and implemented by local jurisdictions. Strategies, protocols, organizational frameworks, and recommendations that may be used to implement a coordinated

evacuation effort within the San Diego County Operational Area are included in the Annex. It identifies estimates on the resident population within each jurisdiction that may be potentially impacted by certain hazards and would require evacuation, the number of residents that may need assistance securing shelter or transportation, and the estimated number of household pets that may need to be accommodated in the event of an evacuation effort. In addition, the Annex provides hazard-specific considerations, transportation routes, and capacities for general evacuation, shelter capacities throughout the county, locally available resources, resources available through mutual aid, and other special needs considerations.

The Annex includes hazard-specific evacuation routes for dam failure, earthquakes, tsunamis, floods, and wildfires. Primary evacuation routes consist of the major interstates, highways, and prime arterials within San Diego County.

In addition, the City of San Diego's Fire-Rescue Department Community Emergency Response Teams (CERTs) help local communities build a base of emergency preparedness to rely on when needed. The CERT program brings together neighbors, team members, and co-workers within their own community, in coordination with the San Diego Fire-Rescue Department. Other agencies—such as the City of San Diego's Office of Homeland Security, the City's Police Department, the San Diego County Sheriff's Department, and the County of San Diego's OES—also offer coordinated services in the event of an emergency or evacuation.

4.8.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the CEQA Guidelines. Impacts to hazards and hazardous materials would be considered significant if the Proposed Project:

- Creates a hazard to public health or the environment by the routine transport, use, or disposal of hazardous materials
- Creates a hazard to the public or the environment by reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment
- Emits hazardous emissions or handle hazardous materials within 0.25 mile of a school
- Is located at a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, creates a hazard to the public or the environment
- Is located within two miles of a public or private airport and results in a safety hazard for people residing or working in the Proposed Project area
- Impairs implementation of, or physically interferes with, an adopted emergency response or evacuation plan
- Exposes people or structures to a risk of loss, injury, or death related to wildland fires

Question 4.8a – Hazardous Material Transport, Use, or Disposal

Construction – Less-than-Significant Impact

It is possible that impacts could occur from the transport or use of hazardous materials during the construction phase as the result of incidental spills or other unauthorized releases during foundation excavation and construction; trenching; conductor pulling, splicing, and tensioning during the installation of the 69 kV loop-in and distribution circuits and during the upgrade of the telecommunication system; and transformer transporting and/or oil filling. Other potential impacts relative to the use of hazardous materials could occur during construction at temporary storage sites, from transportation of materials or workers to worksites, or during the refueling or servicing of equipment. Vehicles and equipment used for construction may contain or require temporary, short-term use of potentially hazardous substances, such as fuel, lubricating oils, or hydraulic fluid.

In addition, material that is excavated, transported, stored, or disposed of during construction of the Proposed Project has the potential to contain hazardous materials and could present a hazard to construction workers, the public, or the environment if improperly managed. Vehicles and equipment used for construction may contain or require temporary, short-term use of potentially hazardous substances, such as fuel, lubricating oils, or hydraulic fluid. Groundwater is not anticipated to be encountered during excavation because the excavation will occur above the water table. Should groundwater be encountered, the procedures described in Section 3.6.3 Methods in Chapter 3 – Project Description regarding groundwater discharge will be followed. In addition, a Health and Safety Plan will be prepared to provide guidance for site workers in the case of contamination discovery at the proposed Vine Substation site.

A general listing of types of chemicals used during construction is provided in Table 4.8-1: Hazardous Materials Typically Used for Construction and/or Operation and Maintenance. In the case of an incidental spill or other unauthorized release, hazardous materials could have the potential to adversely affect the health or safety of construction workers, nearby building occupants or residents, or others within the vicinity of the Proposed Project.

As presented in Section 4.8.2 Existing Conditions, several laws, rules, and regulations apply to the routine use of hazardous materials during construction, which include proper handling and disposal of hazardous materials. SDG&E will comply with all such laws, rules, and regulations. Because construction will require only small amounts of hazardous materials; transport of these materials will only occur during the approximately 19-month construction period; and all spills will be immediately cleaned up and disposed of properly in accordance with SDG&E's Water Quality Construction Best Management Practices Manual (BMP Manual) (included as Attachment 4.8-B: Water Quality Construction Best Management Practices Manual) and with federal, state, and local regulations. In addition, a Hazardous Materials and Waste Management Plan, as described in APM-HAZ-01, will be implemented. This plan will include procedures for the use, storage, and transportation of hazardous materials; protocols for the implementation of secondary containment and countermeasures for hazardous materials; a list of and the locations of spill response materilas, and a description of wast management and disposal procedures. As part of SDG&E's ordinary construction restrictions, a Safety and Environmental Awareness Program (SEAP) will be developed which will include training on hazardous material protocols and best management practices (BMPs). With the adherence to applicable laws and regulations,

implementation of SDG&E's BMP Manual, SEAP training, and implementation of APM-HAZ-01, impacts will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Similar to activities occurring during the construction phase, the use of hazardous materials during ongoing operation and maintenance of the proposed Vine Substation could pose health and safety hazards to SDG&E maintenance staff, area residents, and the surrounding environment as the result of an incidental spill of hazardous substances during routine or emergency maintenance, as well as during daily operation of the facilities. The majority of chemicals used for ongoing operation or maintenance activities will be similar to those used during the construction phase; however, daily use of such chemicals will generally be considerably less during operation and maintenance than during construction. A typical list of the types of hazardous materials used during operations and maintenance is provided in Table 4.8-1: Hazardous Materials Typically Used for Construction and/or Operation and Maintenance. Hazardous chemicals used for operations and maintenance activities, with the exception of the oil contained in the substation transformers, will be transported to and removed from the Proposed Project site by maintenance personnel, rather than stored on site, to reduce the overall potential for accidental release of such substances.

At its ultimate configuration, the proposed Vine Substation will support four standard profile transformers. The four transformers will contain a total of approximately 30,000 gallons of oil. As the transformers age, the potential increases for leaks to occur. Other major natural events (e.g., seismic events) or collisions from maintenance equipment will also have the potential to result in a release into the environment. Storage and use of hazardous materials, including mineral oil, in amounts exceeding 1,320 gallons is regulated under the CWA. Because total materials in excess of this threshold are expected at the proposed Vine Substation site, SDG&E will prepare a site-specific Hazardous Materials Business Plan (HMBP) and Spill Prevention, Control, and Countermeasures (SPCC) Plan, which will contain the proper procedures for storage, handling, spill response, and disposal of hazardous materials, including fueling, maintenance, spill containment, leak inspection, and cleanup procedures, in accordance with the CWA. In addition, the proposed Vine Substation will include oil-retention basins for each transformer to ensure any future leak or spill is fully contained. The basins will be designed to have a capacity that exceeds the transformer capacity by 10 percent. With the installation of the oil-retention basins, which are part of the Proposed Project's design, compliance with California law, which requires the implementation of a HMBP, and adherence to the CWA, which requires a SPCC Plan, the potential impact will be less than significant.

Question 4.8b – Reasonably Foreseeable Upset and Accident Conditions

Construction – Less-than-Significant Impact

The site reconnaissance survey and accompanying database search confirmed that no existing contamination has been identified on the Proposed Project site. As the site is presently a paved surface used for long-term parking and does not contain buildings or structures, with the exception of a small kiosk used to collect payment from customers. The release of hazardous materials (e.g., asbestos) during demolition activities are not anticipated.

Table 4.8-1: Hazardous Materials Typically Used for Construction and/or Operation and Maintenance

Hazardous Materials	
ABC fire extinguisher	Hydraulic fluid
Acetylene gas	Insulating oil (inhibited, non-PCB)
Air tool oil	Lubricating grease
Ammonium hydroxide	Mastic coating
Battery acid (in vehicles and in the meter house of the substations)	Methyl alcohol
Bottled oxygen	Mineral oil
Brake fluid	Motor oils
Canned spray paint	Paint thinner
Chain lubricant (contains methylene chloride)	Propane
Connector grease (penotox)	Puncture seal tire inflator
Contact cleaner 2000	Safety fuses
Diesel fuel	Starter fluid
Diesel fuel additive	Sulfur hexafluoride (within the circuit breakers in the substations)
Eye glass cleaner (contains methylene chloride)	Two-cycle oil (contains distillates and hydro-treated heavy paraffinic)
Gasoline	WD-40
Gasoline treatment	ZEP (safety solvent)
Hot stick cleaner (cloth treated with polydimethylsiloxane)	ZIP (1,1,1-trichloroethane)

As discussed in response to Question 4.8a, hazardous materials used in construction vehicles and equipment could inadvertently be released through spills or leaks. In addition, because the northeastern area of the proposed Vine Substation site was previously used as a gas station, there is potential for contamination to be encountered during excavation of the site. As discussed in the response to Question 4.8a, a Health and Safety Plan will be prepared to provide guidance for site workers to identify potential contamination and to appropriately respond in the case of contamination discovery at the proposed Vine Substation site. In addition, construction of the Proposed Project will be subject to the laws and regulations governing the handling and disposal of hazardous materials. All relevant local, state and federal regulations will be adhered to. As a result and with preparation of a project-specific Hazardous Materials and Waste Management Plan proposed by APM-HAZ-01, the potential impact will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Hazardous material impacts could occur as a result of incidental spills during normal operation or routine or emergency maintenance at the proposed Vine Substation. SDG&E and its contractors will be subject to and will follow all relevant local, state, and federal regulations regarding the transport, storage, use, handling, and spill response for hazardous materials. Vehicles and equipment that will be used to maintain Proposed Project facilities may contain materials that could constitute a hazardous substance if released into the environment; however, the use of such chemicals will typically be considerably less than those used during Proposed Project construction activities. To reduce the potential for adverse effects to occur, SDG&E will maintain spill kits in maintenance vehicles to effectively respond to incidental spills as part of their ordinary operation restrictions. In addition, as discussed in the response to Question 4.8a, SDG&E will implement a HMBP and SPCC Plan, as required by law, to prevent or address any accidental release of hazardous materials. As such, potential impacts from operation and maintenance of the proposed Vine Substation will be less than significant.

Question 4.8c – Hazardous Substances in Close Proximity to Schools

Construction – Less-than-Significant Impact

Schools within 0.25 mile of the Proposed Project are considered to be sensitive receptors. One school, the Montessori School of San Diego, is located approximately 0.25 mile southeast of the Proposed Project. The next nearest school is located approximately 0.7 mile to the north of the Proposed Project. As discussed in the response to Question 4.8a, impacts associated with hazardous material transport, use, or disposal during construction are considered to be less than significant. In addition, as discussed in the response to Question 4.8b, impacts associated with reasonably foreseeable upset and accident conditions are considered to be less than significant due to the implementation of an SPCC and the maintenance of spill kits by substation personnel. In addition, as discussed in the response to Question 4.8b, a Health and Safety Plan will be prepared to guide construction workers on how to properly manage any contamination discovery and a project-specific Hazardous Materials and Waste Management Plan, as described in APM-HAZ-01, will be implemented. Therefore, construction of the Proposed Project is not expected to cause a significant health or environmental hazard, and potential impacts from the use of hazardous substances within proximity to schools will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

As discussed in the response to Question 4.8a, the use of hazardous materials during operation and maintenance will generally be considerably less than during construction. Hazardous chemicals used will be transported to and removed from the Proposed Project site by maintenance personnel, rather than stored onsite, and therefore will not cause significant health or environmental hazards. In addition, the installation of the oil-retention basins and implementation of a SPCC Plan, as required by law, will ensure that any hazardous materials leak or spill at the proposed Vine Substation will be fully contained and appropriately controlled during operation. Therefore, potential impacts from the use of hazardous substances within proximity to schools during operation and maintenance will be considered less than significant.

Question 4.8d – Existing Hazardous Materials Sites Listed in Government Code Section 65962.5

Construction – No Impact

Construction of the Proposed Project will not result in any impacts related to known hazardous materials sites listed in Government Code § 65962.5, as no known hazardous sites have been identified on the Proposed Project site or on adjacent lands. Although two open sites with past or current hazardous materials cases were identified within 0.25 mile of the Proposed Project, they do not pose significant risk to the Proposed Project due to their localized nature, present regulatory status, and lack of violations reported. Furthermore, the sites are located down gradient or cross gradient with ground water flow, generally in a south to southwest direction away from Proposed Project site. No hazardous materials have been identified on the Proposed Project site; however, there is potential for contamination due to the site's previous use as a gas station. As discussed in the responses to Questions 4.8b and 4.8c, a Health and Safety Plan will be prepared and implemented in the case of contamination discovery. In addition, the groundwater table is at a sufficient depth such that encountering groundwater during excavation activities is not anticipated. A SPCC Plan, BMPs, and APM-HAZ-01 will also be implemented during construction. As a result, impacts will be less than significant.

Operation and Maintenance – No Impact

Long-term operation and maintenance activities will not result in significant impacts, as no known existing hazardous materials or contamination sites listed in Government Code § 65962.5 are located on site. As previously mentioned, two open sites with past or current hazardous materials cases exist within 0.25 mile of the Proposed Project, but do not pose significant risk to the Proposed Project. Future maintenance activities for the proposed Vine Substation will primarily occur on above-grade structures, thereby minimizing the potential for the uncovering of existing, unknown hazardous materials sites during such activities. Therefore, no impacts will occur.

Although the distribution and telecommunication system components will be installed underground, once construction is complete, operation and maintenance activities will not further disturb underlying surfaces or require activities with the potential to encounter unknown hazardous materials sites. As such, no impacts will occur.

Question 4.8e – Public Airport Hazards – *Less-than-Significant Impact*

The Proposed Project site is located approximately 0.75 mile from the SDIA. The Proposed Project will be designed and constructed in accordance with the noise, safety, airspace protection, and overflight policies and standards described in the SDIA ALUCP, which were designed to prevent new structures from becoming hazards to air navigation. Per the SDIA ALUCP, structures that are 200 feet above ground level will require coordination with the Federal Aviation Administration (FAA).

Per the SDIA ALUCP requirements, coordination with the FAA is required prior to construction of the Proposed Project due to its proximity to SDIA. Because the 69 kV steel poles—which will reach approximately 100 feet high and are located within one mile from the airport—will exceed the one-to-100 ratio required by 14 CFR § 77.9 for airspace and navigation, SDG&E will consult with the FAA. The FAA will conduct an obstruction evaluation, for which the resulting requirements will be implemented by SDG&E. Because the SDG&E will comply with FAA requirements should an airport obstruction be identified, impacts to public airports will be less than significant.

Question 4.8f – Private Airstrip Hazards – *No Impact*

No components of the Proposed Project are located within two miles of a private airstrip and, therefore, will not affect or disrupt existing operations or worker safety at such a facility. As a result, no impact will occur.

Question 4.8g – Emergency Evacuation and Response Plan Interference – *Less-than-Significant Impact*

Construction – Less-than-Significant Impact

No conflicts with public safety or emergency response and evacuation plans have been identified for construction or operation of the proposed Vine Substation. The majority of construction equipment, vehicles, personnel, and material staging areas will be accommodated within the property lines of the proposed Vine Substation site. Equipment staging will also occur at other existing SDG&E facilities. Temporary parking of limited construction-related vehicles along Vine Street may be required depending on actual construction activities occurring at the proposed Vine Substation site. Emergency access will not be affected during construction, as all streets will remain open to emergency vehicles at all times.

The 12 kV distribution relocation, 69 kV loop-in, and telecommunication system extension will be constructed within public roadways. As part of the 12 kV distribution relocation, underground duct banks will be constructed within Kettner Boulevard between West Laurel Street and the proposed Vine Substation. Three existing duct banks will also be utilized: within Pacific Highway between West Hawthorn Street and West Laurel Street; West Laurel Street between Pacific Highway and Kettner Boulevard; and Kettner Boulevard between West Hawthorn Street and West Laurel Street. The telecommunication system extension will use the same right-of-way (ROW) as the distribution conduits.

As described in detail in Section 4.16 Transportation and Traffic, temporary land and/or road closures will be necessary during some construction activities to provide safety to the public and

workers within public areas and roadways. In addition, some roads may be temporarily limited to one-way traffic at times, in which case one-way traffic controls will be implemented as required. Road closures and encroachment into public roadways could increase hazards if the appropriate safety measures are not in place, such as proper signage, orange cones, and flaggers. However, SDG&E will obtain the required encroachment permits from the City of San Diego and implement traffic control measures accordingly. In addition, construction within the road may be limited to nighttime hours to avoid traffic impacts during peak hours, and emergency vehicles will be provided access during the temporary road and/or lane closures. Therefore, emergency access will not be directly impacted during construction. In addition, in the event of an emergency requiring evacuation, SDG&E will ensure that all potential routes are open and accessible for public use by limiting trenching activities to approximately 500 linear feet per day within a single lane of traffic. As a result, any potential impacts during construction will be less than significant.

Operation and Maintenance – No Impact

Operation and maintenance of the proposed Vine Substation will not require any road or lane closures and, therefore, will not interfere with any emergency vehicle or evacuation routes. Maintenance of the 12 kV distribution relocation and telecommunication system extension may require temporary lane closures, but are expected to be short in duration and will not deviate from the maintenance of existing distribution and telecommunication system alignments in the area. In addition, all required traffic control measures will be implemented accordingly, and emergency vehicles will be provided access during potential road and lane closures caused by maintenance activities. Therefore, no impact will occur during operation and maintenance.

Question 4.8h – Wildland Fires – *No Impact*

The Proposed Project site will be located in an urban area with little to no vegetation on site. As previously discussed, the Proposed Project site is not located in a wildland fire hazard area. In addition, the mechanical and structural design and construction of the new 69 kV power lines must meet the requirements of the California Public Utilities Commission (CPUC) General Order No. 95 (GO 95), Rules for Overhead Electric Line Construction. Although energized conductors can create potential for a fire hazard, SDG&E takes into account normal and unusual structural loading in its designs under GO 95 to prevent these fire hazards. Therefore, no impact will occur.

4.8.4 Applicant-Proposed Measures

The following measure is provided to ensure that impacts remain at a less-than-significant level:

- APM-HAZ-01: Prior to approval of the final construction plans for the Proposed Project, a project-specific Hazardous Materials and Waste Management Plan will be prepared for the construction phase of the Proposed Project to ensure compliance with all applicable federal, state, and local regulations. The Hazardous Materials and Waste Management Plan will reduce or avoid the use of potentially hazardous materials for the purposes of worker safety, protection from groundwater contamination, and proper disposal of hazardous materials. The plan will include the following information related to hazardous materials and waste, as applicable:

  - A list of the hazardous materials that will be present on site during construction, including information regarding their storage, use, and transportation;

  - Procedures for the identification of and avoidance of contaminated materials;

  - Any secondary containment and countermeasures that will be required for onsite hazardous materials, as well as the required responses for different quantities of potential spills;

  - A list of spill response materials and the locations of such materials at the Proposed Project site during construction;

  - A list of the adequate safety and fire suppression devices for construction activities involving toxic, flammable, or exposure materials;

  - A description of the waste-specific management and disposal procedures that will be conducted for any hazardous materials that will be used or are discovered during construction of the Proposed Project; and

  - A description of the waste minimization procedures to be implemented during construction of the Proposed Project.

1 INTRODUCTION

This report documents the results of the Phase I Environmental Site Assessment (ESA) performed by Geosyntec Consultants (Geosyntec) for the Proposed Vine Substation Property located at 3550 Kettner Boulevard, San Diego, California (Figure 1; the Site). The Site includes one parcel of land identified by the San Diego County Assessor's Office as Parcel Number 451-690-1800 comprising approximately 1.5 acres (Figure 2). This Phase I ESA was prepared in accordance with the scope of work, terms and conditions described in Geosyntec's proposal dated 21 March 2014. This report incorporates, by reference, the American Society of Testing and Materials (ASTM) Standard E 1527-13, "Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process." Exceptions and limitations are provided in Section 1.5 of this report. Geosyntec performed the Phase I ESA for the sole use of its client, San Diego Gas & Electric (SDG&E).

1.1 Purpose

The purpose of this Phase I ESA was to identify, to the extent feasible, "Recognized Environmental Conditions[1]" (RECs) at the Site as the "REC" term is defined by ASTM E 1527-13. This REC definition eliminates from consideration several conditions that could fall under the general definition of "environmental issues" and focuses on known or potential releases of hazardous substances and petroleum products. In addition to this general limitation, specific conditions that were not considered to be within the scope of this Phase I ESA are identified in Section 1.5 of this report. Geosyntec understands this Phase I ESA was prepared to help identify potential environmental liabilities associated with the Site prior to redevelopment as an electrical substation.

1.2 Site Description

The Site is approximately rectangular in shape, comprising approximately 1.5 acres, located on the corner southwest of Kettner Boulevard and southeast of Vine Street (Figure 2). The Site can be accessed by a gate along Vine Street.

1.2.1 Site Characteristics

The Site is currently occupied by a Park 'N Fly Airport Parking lot. The Site is surrounded by a chain link fence, and paved with asphalt. The Site includes approximately 220 parking stalls, a guard shack, and a wooden storage shed (Figure 3).

[1] As defined by ASTM E 1527-13, a Recognized Environmental Condition is: "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."

1.2.2 Surrounding Land Uses

Northwest of the Site across Vine Street is a commercial property occupied by Rush Press, and across California Street is a parking lot partially used for rental car parking (Honeywell property); northeast of the Site across Kettner Boulevard, Interstate-5 Freeway corridor, and India Street are a gasoline service station, commercial properties, and a residence; southeast of the Site is a vacant rental car facility including a car wash, fueling area, and parking lot; and southwest of the Site across a railroad corridor and Pacific Highway are parking lots (Figure 2).

1.3 Geologic and Hydrogeologic Summary

The Site lies at an approximate elevation of 40 feet above mean sea level. Based on a review of available geologic maps, the Site is located on the seaward edge of a Pleistocene marine terrace; however, just west of the Site boundary is a man-made plain comprised of hydraulic fill [Kennedy and Tan, 2005]. The Site is located within the Newport-Inglewood-Rose Canyon Fault Zone, which consists of right-lateral strike-slip faults, some segments of which have been active in Recent time [Lindvall and Rockwell, 1995].

Soil borings advanced at the Site by Geosyntec during a previous geotechnical evaluation indicated Site soil consists of interbedded silty sand, sand, silt, and clay to the maximum depth explored of 100 feet below ground surface (bgs) [Geosyntec, 2013]. Groundwater was encountered at approximately 25 feet bgs. During drilling activities, soil was screened with a photoionization detector (PID) for the presence of volatile constituents; however, no measurable concentrations were detected.

The Site is located within the Lindbergh Hydrologic Subarea of the San Diego Mesa Hydrologic Area of the Pueblo San Diego Hydrologic Unit (908.21). Beneficial use designations do not apply for groundwater in the San Diego Mesa Hydrologic Area west of the Interstate Highway 5 [RWQCB, 2007]. Therefore, no existing or potential beneficial uses are designated for groundwater beneath the Site.

Based on a groundwater monitoring report for a former Honeywell property located approximately 350 feet northwest of the Site, shallow groundwater in the Site vicinity is encountered at depths of approximately 20 feet bgs and generally flows to the south-southwest at an average hydraulic gradient of 0.005 ft/ft [CH2MHILL, 2008]. Groundwater is likely brackish to saline due to salt water intrusion from San Diego Bay.

1.4 Scope of Services

Geosyntec was authorized on 21 March 2014 by Ms. Barbara Montgomery of SDG&E to complete a Phase I ESA of the Site. The scope of services included the following:

- Searching standard local, state, and federal environmental record sources within recommended ASTM search distances;

- Reviewing available physiographic information including topographic, geologic, and hydrogeologic information;
- Reviewing historical aerial photographs;
- Reviewing historical fire insurance maps;
- Performing a Site reconnaissance;
- Conducting an interview with the Site manager; and
- Documenting the procedures, findings, opinions, and conclusions of the Phase I ESA in this report.

This work was completed in general accordance with ASTM Practice E 1527-13 with the limitations and exceptions described in Section 1.5 of this report. For the purposes of this Phase I ESA report, SDG&E represents the "user," defined as "the party seeking to use Practice E 1527-13 to complete an *environmental site assessment* of the *property*…"

This ESA report was prepared by Mr. Douglas Baumwirt, PG and reviewed by Mr. Veryl Wittig, PG ("environmental professionals", as defined under the ASTM Practice E 1527-13) of Geosyntec, in accordance with the peer review policy of the firm. Mr. Baumwirt's professional qualifications are presented in Appendix A.

1.5 Limitations and Exceptions

This Phase I ESA was performed according to the agreed upon scope of work with SDG&E. This Phase I ESA is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with the Site, and recognizes reasonable limits of time and cost. Not every property warrants the same level of assessment. Consistent with good commercial or customary practice, the appropriate level of assessment was guided by the type of property subject to assessment and the information developed in the course of the inquiry.

Additional services considered optional by ASTM E 1527-13, such as asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, biological agents, mold, and high voltage power lines, were not included in the scope of work.

The findings and conclusions presented in this Phase I ESA are the result of professional interpretation of the information collected at the time of this study. This Phase I ESA was not an exhaustive search of all available records, nor does it include detailed assessment of all Phase I ESA findings. Geosyntec cannot "certify" or guarantee that any property is free of environmental impairment; no warranties regarding the environmental quality of the property are expressed or implied.

This Phase I ESA did not include the sampling of rock, soil, groundwater, surface water, soil vapor, air, or on-Site substances or materials. Therefore, it is not possible to confirm the presence or absence of hazardous substances or petroleum products in the environments associated with the property.

The findings of this report, to the best of our knowledge, are valid as of the date of this work. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate regulations and standards may occur, whether they result from legislation, from the broadening of knowledge, or from other reasons. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control.

Specified information contained in this report has been obtained from publicly available sources and other secondary sources of information. Although care has been taken in compiling this information, Geosyntec disclaims any and all liability for any errors, omissions, or inaccuracies of the third parties in such information and data.

The work was performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the findings, opinions, conclusions, and recommendations included in this report.

1.6 User Reliance

This Phase I ESA report has been prepared solely for the benefit of SDG&E. Geosyntec has issued the Phase I ESA report to its client and grants SDG&E the right to rely on the report contents. Except as specifically set forth in Geosyntec's proposal to SDG&E to perform this work, no third party shall have the right to rely on Geosyntec's opinions rendered in connection with the Services without SDG&E's approval and Geosyntec's written consent which may be conditioned on the third party's agreement to be bound to acceptable conditions and limitations similar to this Agreement.

2 USER PROVIDED INFORMATION

In accordance with ASTM E 1527-13, Geosyntec requested that the user of the Phase I ESA provide information that would assist in identifying the possibility of RECs in connection with the subject property, including but not limited to:

- Reviewing title and judicial records for environmental liens or activity and use limitations recorded against the subject property;
- Communicating specialized knowledge or experience that is material to RECs in connection with the subject property;
- Providing information about previous ownership or uses of the property;
- Providing information on a significantly lower purchase price, if applicable; and
- Designating personnel who are the most knowledgeable at the Site that will be interviewed by Geosyntec personnel.

2.1 Title Records

The user did not provide title records for the Site.

2.2 Environmental Liens

The user did not report any environmental liens against the property.

2.3 Specialized Knowledge

The user did not provide specialized knowledge regarding the Site pertinent to recognized environmental conditions. However, SDG&E provided a summary of prior database findings for the Site vicinity (Appendix B).

2.4 Commonly Known or Reasonably Ascertainable Information

The user did not provide any commonly known or reasonably ascertainable information material to RECs in connection with the property.

2.5 Valuation Reduction for Environmental Issues

The user did not report property valuation information for the Site; however, Geosyntec understands that SDG&E has owned the Site since at least 1980.

2.6 Owner, Property Manager, and Occupant Information

Geosyntec interviewed Ms. Patty Glass, the SDG&E Corporate Real Estate Agent for the Site (Section 4.1).

2.7 Reason for Performing Phase I ESA

Geosyntec understands that SDG&E has requested this Phase I ESA as part of pending redevelopment of the Site as an electrical substation.

3 RECORDS REVIEW

3.1 General

The following sections present the results of the environmental database search, review of reasonably ascertainable historical aerial photographs, topographic maps, fire insurance maps, and city directories.

3.2 Database Search Report

The database search report was obtained from Environmental Data Resources, Inc. (EDR) (Appendix C). The report documents findings of various federal, state, and local regulatory database searches regarding properties with known or suspected releases of hazardous materials or petroleum hydrocarbons. The searches were performed according to ASTM standards for Phase I ESA database searches. A list and description of the databases searched are included within the EDR report.

3.2.1 Site

The Site was identified with in the EDR US Historical Auto Stations database as a gasoline and oil service station in 1927, 1930, 1933, and 1943. Additionally, the Site may also be listed with the address of 3526 Kettner Boulevard as a historical gasoline station in 1970.

3.2.2 Adjoining Properties

Numerous properties adjoining the Site were identified in the databases searched by EDR. Several historical auto stations were formerly located along Pacific Highway southwest of the Site and along India Street northeast of the Site, including a Chevron located at 3535 India Street (approximately 350 feet northeast of the Site across Kettner Blvd., Interstate-5, and India Street) which has had a documented release of gasoline from an underground storage tank (UST) to groundwater upgradient of the Site. The rental car facility southeast of the Site formerly contained several gasoline, diesel fuel, and waste oil USTs; and several small quantity generators of hazardous wastes were located northwest of the Site. However, the most notable adjoining property is the former Baron-Blakeslee facility (currently referred to as Honeywell, Inc., the existing responsible party) which adjoins the Site to the northwest across Vine and California Streets (approximately 250 feet northwest). The Honeywell facility is listed as a former transportation, storage, and disposal facility that included aboveground storage tanks (ASTs) and USTs that resulted in the release of chlorinated solvents and other hazardous substances to soil and groundwater. Remediation is ongoing with regulatory oversight from the California Department of Toxic Substances Control (DTSC).

Based on the regulatory database listings identified by EDR, and the nature of activities associated with former and current occupants of properties adjoining the Site, it is likely that soil, groundwater, and/or soil vapor at the Site have been impacted by hazardous substances or petroleum products.

3.2.3 Properties within ½-Mile of the Site

Numerous properties within ½ mile of the Site were identified with releases of hazardous substances or petroleum products. Topographic and hydraulically upgradient or cross-gradient properties include several gasoline service stations, automotive repair facilities, rental car facilities, and drycleaners. Notable downgradient facilities include various aerospace manufacturing facilities and airport fueling facilities. Based on the regulatory database listings identified by EDR, the nature of activities associated with these facilities, and the number of facilities identified within ½ mile of the Site, it is likely that some of these properties have adversely impacted soil, groundwater, and/or soil vapor at the Site with hazardous substances or petroleum products.

3.2.4 Properties within One Mile of the Site

Five properties within one mile of the Site were identified in RCRA CORRACTS or CERCLIS databases. The most notable listing is the Honeywell, Inc. (Baron-Blakeslee) facility which adjoins the Site to the northwest which is reportedly responsible for releases of chlorinated solvents and other hazardous substances to soil and groundwater in the Site vicinity. No other notable properties within one mile of the Site were identified by EDR in the Federal NPL site list, Federal RCRA CORRACTS facilities list, Department of Defense (DOD) Facilities list, or the state or tribal-equivalent NPL list.

3.2.5 Summary of Database Review

Based on a review of the database search report provided by EDR, the Site was previously occupied by at least one gasoline service station. Records indicate a gasoline service station was located at the Site during two separate intervals, from 1927 to 1943, and in 1970. No indications of a release from fuel tanks at the Site were noted.

The Site vicinity has been used extensively for industrial purposes since the early 1900s. Adjoining properties have been identified for releases of hazardous substances and petroleum products to soil and groundwater upgradient and cross-gradient from the Site. Based on the nature, proximity, and quantity of the facilities identified in the Site vicinity, it is possible that soil, groundwater, and/or soil vapor at the Site have been impacted by hazardous substances or petroleum products.

A review of the list of "orphan sites" identified by EDR in their database search suggests insufficient information is available to accurately plot the properties, or that based on the available information presented, the properties do not appear to be located near the Site.

3.3 Historical Aerial Photographs, Topographic Maps, and Sanborn Maps

Historical aerial photographs (aerials) from 1953 to 2012, USGS topographic (topos) maps for years 1904 to 1991, and Sanborn Maps (Sanborns) from 1921 to 1970 were received from EDR and are provided in Appendices D, E, and F, respectively. Geosyntec also reviewed aerials dated: 1953, 1964, 1972, 1980, 1981, 1989, 1990, 2003, and 2005 online at

www.historicaerials.com; from 1994, 1996, 1998, and 2000 through 2013 online with GoogleEarth; and viewed aerials from 1928 at the San Diego County, Department of Cartographic Services [HistoricAerials, 2014; GoogleEarth, 2014]. A summary of the aerials, Sanborns, and topos reviewed is included below.

- The oldest available topo indicates that a railroad corridor was present by 1904 near the existing railroad corridor which adjoins the Site to the southwest.

- The oldest available Sanborn from 1921 indicates the Site was vacant land with Kettner Boulevard, Vine Street, and the railroad corridor established along the Site boundaries. Additionally, Upas Street was present along the southeastern Site boundary. Sporadic dwellings are plotted on adjoining properties. The 1928 aerial indicated the Site was vacant land.

- The Sanborn from 1950 depicts a chemical warehouse on an adjoining property northwest of the Site across Vine/California Streets. By 1953, the Site was developed as a paved parking lot. Additionally, Upas Street no longer defined the southeastern Site boundary and terminated at Kettner Boulevard, and the new adjoining property to the southeast appeared to be used for residential dwellings. Southwest of the Site, Pacific Highway (Hwy 101) was present and significant hydraulic filling had occurred in the northeast portion of San Diego Bay for Lindbergh Field Municipal Airport and industrial structures. By 1956, the first of several adjoining printing facilities was present north of the Site.

- By 1966 construction of the Interstate-5 Freeway was in progress adjoining northeast of the Site, and by 1967, a gas and oil service station was plotted northeast of the Site, northeast of the intersection of Vine Street and India Street, and a used building materials facility was present adjoining the Site to the southeast.

- By 1969 a gasoline filling station was present on the northern portion of the Site.

- By 1970 the gasoline filling station was present northeast of the Site along India Street (350 feet northeast).

- By 1975, the Site was vacant. The northern portion of the Site formerly occupied by the gas station appeared to be unpaved, and the remaining portion of the Site appeared paved.

- By 1980 the Site was used as a parking lot similar to its current configuration.

- By 2009, the adjoining chemical warehouse facility (Honeywell/Baron-Blakeslee) located approximately 250 feet northwest of the Site had been redeveloped as a parking lot, and by 2010 was used as a rental car facility similar to present.

3.4 City Directories

City Directories were searched by EDR for selected years from 1903 to 2013 to assess occupancy at the Site and adjoining properties (Appendix G). The Site address (3550 Kettner) was identified in the city directory listings from 1927 through 1945 as gasoline service station, and from 1980 through 2013 as the Park 'N Ride. The Site appears to also formerly have been associated with the address 3526 Kettner Boulevard which included a Shell Service Station in 1970.

Notable adjoining properties included the following:

- Battery manufacturing facility (San Diego Lead Products and T. Frank Battery Manufacturing) northwest of the Site across Vine Street (3449 California St.) from 1933 through 1952;

- Chemical manufacturing/recycling facility (Bateman Chemical and Baron-Blakeslee, now Honeywell, Inc.) 250 feet northwest of the Site (3596 California St.) from 1952 to 2008;

- Car rental facility (Hertz) southeast of the Site (3420 Kettner Blvd.) from 1991-2013; previously occupied by a lumber and supply company beginning in 1955;

- Gasoline service station (Chevron) northeast of the Site across Kettner Blvd., Interstate-5, and India St. (3535 India St.) from 1975 through 2013; and

- Auto repair facility (Jeff's Garage) northeast of the Site (3515 Kettner Blvd.) in 1961.

3.5 Local Regulatory Agencies

Geosyntec contacted the following federal, state, and local agencies and accessed associated online databases to identify information pertaining to the Site and applicable adjoining properties. Documents received from the agencies are provided in Appendix B:

- United States Environmental Protection Agency (USEPA) and MyPropertyInfo Database;
- DTSC and EnviroStor Database;
- California Department of Oil, Gas, and Geothermal Resources (DOGGR) Database;
- San Diego Regional Water Quality Control Board (RWQCB);
- State Water Resource Control Board (SWRCB) GeoTracker Database;
- San Diego Air Pollution Control District (APCD);
- San Diego Department of Environmental Health;
- San Diego Building Department;
- San Diego Fire Department; and

- San Diego Industrial Wastewater Control Program.

No evidence of RECs at the Site was identified in files and correspondence received from the above-referenced agencies. However, review of documents reviewed in above-referenced publically-accessible online databases did identify facilities in the Site vicinity that have been documented with releases of hazardous substances and petroleum products to the subsurface that may have impacted the Site. Pertinent documents relating to the adjoining facilities are provided in Appendix B.

The most notable facility identified is the Honeywell International, Inc. (former Baron-Blakeslee facility) which adjoins the Site to the northwest across Vine and California Streets (Figure 2). Based on review of files obtained from the SWRCB's GeoTracker database and DTSC's EnviroStor database, the former Baron-Blakeslee facility was initially operated as a chemical manufacturing facility (1952-1969) and was later converted to a hazardous chemical recycling/disposal facility (1969-1993), including chlorinated and fluorinated solvents. Following cease of operations at the facility in 1993, several investigations were performed at the facility under regulation of the DTSC which identified significant concentrations of chlorinated hydrocarbons in soil, groundwater, and soil vapor at that property, including concentrations indicative of dense non-aqueous phase liquid. Based on reported soil vapor concentrations, a land use covenant was established to restrict the Honeywell property from use as a residence, hospital, school, or other sensitive land uses.

Based on the Site's designation with non-beneficial groundwater uses, many cases listed nearby the Site have been closed with residual impacts in place. Three closed leaking UST facilities (3625, 3585, and 3535 India Street) are located upgradient of the Site within ¼ mile.

As of the date of this report, responses have not been received from the Fire Department or APCD. If files are received after finalization of this report which change the conclusions herein, an addendum will be prepared.

3.6 Previous Site Assessment Reports

No previous environmental site assessment reports were identified for the Site; however, a prior preliminary geotechnical and geologic hazards report prepared for the Site by Geosyntec in 2013 was reviewed for indications of environmental impacts at the Site [Geosyntec, 2013]. The previous geotechnical evaluation at the Site included five soil borings and referenced prior test pits advanced at the Site (including two soil borings and one test pit located within the footprint of the former gasoline station at the Site). The report indicated that a former gasoline station may have been present at the Site; therefore, soil was screened in the field with a PID during advancement of soil borings to evaluate organic vapors in the soil; however, no soil samples were retained for environmental laboratory analysis. The report indicated that no measurable concentrations of organic vapors were detected in soil screened at the Site. In addition to the soil screening, the report noted no obvious indications of impacts at the Site.

4 INTERVIEWS

4.1 Interview of Property Owner

On 4 April 2014 Geosyntec interviewed Ms. Patty Glass, SDG&E Corporate Real Estate Agent. During the interview, questions were asked regarding Site use and conditions, typical of a Phase I ESA interview in accordance with ASTM E 1527-13.

Ms. Glass indicated that she has been affiliated with the Site since August 2013, but that SDG&E purchased the Site in 1976 with the intent to build a substation at the Site in the future. Based on her knowledge, the Site was vacant land at the time of purchase and has been leased to various parking lot operators since then. Ms. Glass indicated that the existing lease with Park 'N Ride for the Site will be terminated on 1 March 2015.

When asked about the presence of hazardous substances or petroleum products, tanks, drums, wells, or drains at the property, Ms. Glass indicated that the she is not aware of any, and that the list specifically prohibits the storage or use of hazardous materials at the Site.

Ms. Glass reported that she had no knowledge of spills, leaks, or environmental incidents associated with the property.

4.2 Interview of State and/or Local Officials

No case managers were identified at any of the regulatory agencies which may have had files related to the Site; therefore, interview of regulatory personnel was not performed.

5 SUMMARY OF SITE RECONNAISSANCE

5.1 Methodology

The following section summarizes observations made during the Site reconnaissance performed by Mr. Douglas Baumwirt, PG of Geosyntec, on 28 March 2014. The Site reconnaissance included a walking survey of the Site. The adjoining properties were inspected by driving on public roads. Figure 2 depicts the Site vicinity and features as identified during the Site reconnaissance. Photographs taken during the Site reconnaissance are included in Appendix H.

5.2 Reconnaissance Observations

A summary of the reconnaissance observations is provided in Table 1.

6 SUMMARY OF FINDINGS

Geosyntec performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of the proposed Vine Substation property located at 3550 Kettner Boulevard, San Diego, California. This assessment revealed the following:

6.1 Site Conditions and Use

The Site is approximately rectangular in shape, comprises approximately 1.5 acres, and is located on the corner southwest of Kettner Boulevard and southeast of Vine Street (Figures 1 and 2). The Site can be accessed by a gate along Vine Street. The Site is currently occupied by a Park 'N Fly Airport Parking lot. The Site is surrounded by a chain link fence and paved with asphalt. The Site includes approximately 220 parking stalls, a guard shack, and a wooden storage shed (Figure 3).

6.2 Offsite Conditions and Use

Northwest of the Site across Vine Street is a commercial property occupied by Rush Press (formerly occupied by a battery manufacturing facility) and a vacant lot formerly occupied by Honeywell (formerly Baron-Blakeslee hazardous waste recycling/disposal facility); northeast of the Site across Kettner Boulevard, Interstate-5 Freeway corridor, and India Street are a gasoline service station, commercial properties, and a residence; southeast of the Site is a vacant rental car facility including a car wash, fueling area, and parking lot; and southwest of the Site across a railroad corridor and Pacific Highway are parking lots (Figure 2).

The Site is located in an area used extensively for industrial purposes since the early 1900s, including aerospace manufacturing facilities, airport support facilities, chemical manufacturing, automotive fueling and service stations, drycleaners, and other commercial and residential properties.

6.3 Data Gaps

Based upon the available information, it is believed that data gaps exist but have not affected the identification of RECs at the Site. Following a thorough investigation, it appears that "data gaps" as defined by ASTM, exist for the Site as follows:

- Responses to file review requests for the Site have not been received from each agency.
- A discrepancy exists between data sources regarding the earliest use of the Site as a gasoline service station. Historic city directories indicate the Site included a service station as early as 1927; but physiographic sources do not confirm the existence of a service station at the Site during that time period. However, sources agree that a service station was present at the Site beginning in 1969. Therefore, this discrepancy does not represent data failure and has not precluded the identification of RECs at the Site for the former presence of a service station.

- Pertinent regulatory agencies (RWQCB and DEH) reported that documents pertaining to the onsite service station(s) and the nature and removal of fuel tanks at the Site do not exist. However, based on the time period the former service station(s) at the Site has been classified as a REC. Therefore, the lack of documentation regarding fuel tanks at the Site has not precluded the identification of RECs at the Site.

6.4 Recognized Environmental Conditions

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of the Site which encompasses approximately 1.5 acres located at 3550 Kettner Boulevard, San Diego, California. Any exceptions to, or deletions from, this practice are described in Section 6.3 Data Gaps of this report. This assessment has revealed no evidence of Recognized Environmental Conditions, Controlled Recognized Environmental Conditions, or Historical Recognized Conditions in connection with the property, with the following exceptions:

Recognized Environmental Conditions

- The Site was formerly used as a gasoline service station and automotive repair facility. Although documentation regarding removal of fuel tanks from the Site has not been identified, based on the time period of operation of the former service station and repair facility at the Site, the possibility exists for a release of petroleum products to have occurred at the Site. However, geotechnical soil borings advanced at the Site did not identify obvious impacts or the presence of existing USTs at the Site. Therefore, the magnitude of the possible release is likely insignificant.
- An adjoining parcel located approximately 250 feet northwest of the Site across Vine and California Streets formerly contained a chemical manufacturing facility and hazardous waste disposal/recycling facility (Honeywell/formerly Baron-Blakeslee). Chlorinated hydrocarbons and other hazardous substances have been released to soil and groundwater from the former facility. Based on available groundwater analytical data, the potential exists for the release to have impacted groundwater or soil vapor at the Site with diluted concentrations of volatile organic compounds. This case remains open with the DTSC, but a land use restriction covenant for the Honeywell facility indicates the property, as remediated to date, is acceptable for use as a non-occupied property with restricted uses. Therefore, this adjoining facility does not appear to present a significant risk to the proposed future Site use as an electrical substation.
- Based on the Site vicinity history and presence of several additional facilities in the Site vicinity (including a battery manufacturing facility, aerospace manufacturing facilities, drycleaners, paint shops, and other facilities documented to handle hazardous materials and petroleum products), it is possible that releases from these facilities have migrated in groundwater or soil vapor to the Site.

Historical Recognized Environmental Conditions

- Several documented releases of petroleum products from upgradient gasoline service stations may have impacted soil, groundwater, and/or soil vapor at the Site. However,

due to the non-beneficial groundwater use designation for the Site vicinity, these cases have been closed and do not appear to present a significant risk to the proposed future Site use as an electrical substation.

6.5 De Minimis Conditions

De minimis conditions are environmental conditions which generally do not present a threat to human health or the environment and that generally would not be the subject of enforcement action if brought to the attention of the appropriate governmental agencies. Conditions determined to be *de minimis* are not RECs. *De minimis* conditions at the Site include:

- The existing railroad corridor present along the southwestern Site boundary has been present prior to 1904. Railroads are commonly associated with shallow soil impacts relating to heavy metals and wood preservatives. However, the railroad corridor is topographically downgradient from the Site, and no evidence of impacts to soil or groundwater from the railroad tracks near the Site was identified.

7 CERTIFICATION

This environmental site assessment (ESA) was prepared in accordance with the scope of work, terms and conditions described in Geosyntec's proposal dated 21 March 2014. This proposal incorporated by reference the ASTM Standard E 1527-13, *Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process*.

"I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40CFR 312 and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR part 312."

TABLES

Table 1
Summary of Site Reconnaissance
Proposed Street Substation
San Diego, California

Geosyntec consultants

ASTM Section	Feature or Condition	Description
General Site Setting		
9.4.1.1 & 9.4.1.2	Current and Former Property Usage	The Site is currently used as a parking lot, including a guard shack. Previous Site usage included a gasoline service station.
9.4.1.3 & 9.4.1.4	Current and Former Adjoining Property Usage	The adjoining property to the south is vacant, but was formerly used as a rental car facility, and currently include the car wash and gasoline AST. Adjoining property to the west is a railroad corridor followed by commercial properties including a termite and pest control facility, Pacific Highway, and parking lots. Adjoining property to the north across Vine Street is a commercial building occupied by Rush Press. A former solvent recycling facility (Barron-Blakeslee) formerly occupied a vacant area across Vine Street northwest of the Site. East of the Site across Kettner Blvd is the Interstate-5 Freeway corridor followed by India Street and a gasoline service station.
9.4.1.5	Current and Former Use of Surrounding Area	The Site vicinity is currently used for a mix of commercial, and industrial activities. The area formerly including various additional industrial facilities and residential properties.
9.4.1.6	Geology, Hydrogeology, Hydrology, Topography of Site and Adjoining Properties	The Site is located on fill, colluvium, and old paralic deposits of silts, sands, and cobbles. The Site slopes gently toward the southwest toward the railroad corridor. Groundwater is approximately 25 feet below the ground surface, and flows toward the south.
9.4.1.7	Onsite Structures	Two structures were observed onsite, a guard shack at the entrance, and a wooden shed in the northwest corner of the Site.
9.4.1.8	Roads and Parking Areas	The Site is a parking lot, paved with asphalt.
9.4.1.9	Potable Water supply	A water source was not observed onsite.
9.4.1.10 & 9.4.4.7	Sewage Disposal or Septic Systems	Sewage or septic systems were not observed onsite.
Interior and Exterior Observations		
9.4.2.3 & 9.4.2.8	Hazardous Substances or Petroleum Products	No evidence of hazardous substances or petroleum products was observed onsite, except for small quantities contained within the cars parked onsite.
9.4.2.4	Underground Storage Tanks	No known USTs are currently present at the Site.
9.4.2.4	Above-ground Storage Tanks	No known ASTs are currently present at the Site; however, a gasoline AST was observed on the property adjoining southeast of the Site, approximately 25 feet from the Site boundary.
9.4.2.5	Odors	No suspicious odors were noted.
9.4.2.6	Pools of Liquids	No pools of liquid were observed onsite.
9.4.2.7	Drums and Containers > 5 Gallons	No drums or containers were observed onsite.
9.4.2.9	Unidentified Substances/Containers	No unidentified substances were observed onsite.
9.4.2.10	PCB Items	Evidence of PCB-containing items was not observed onsite.
Interior Observations		
9.4.3.1	Heating and Cooling Systems	No evidence of heating or cooling systems was observed onsite.
9.4.3.2	Stains/Corrosion	No interior staining was observed.
9.4.3.3	Drains and Sumps	No drains were observed onsite.
Exterior Observations		
9.4.4.1	Pits, Ponds, or Lagoons (Onsite and Adjoining)	No pits, ponds, or lagoons observed onsite.
9.4.4.2	Stained Soil or Pavement	Minor staining was observed on pavement in parking stalls at the Site, but none indicative of a significant release to the subsurface.
9.4.4.3	Stressed Vegetation	No stressed vegetation was observed at the Site.
9.4.4.4	Solid Waste	No evidence of solid waste disposal was observed onsite.
9.4.4.5	Wastewater or Stormwater Discharge	Surface water appears to flow southwesterly across the Site to a concrete swale along the Site boundary which conveys surface water to a storm drain.
9.4.4.6	Wells	No wells were observed at the Site.

Contaminated Site Mitigation/Remediation
Mineral Remoteness Evaluations
Hazardous Materials Management
Litigation Support
Project Management

CAREER SUMMARY

Mr. Baumwirt joined Geosyntec Consultants in 2005 after working in the legal and geotechnical consulting fields. Representative experience includes the performance of Phase I Environmental Site Assessments (ESAs); extensive work plan preparation and implementation; coordination and mobilization of diverse field activities; sample collection; statistical analyses; preparation of groundwater monitoring, phase II environmental site assessment, site conceptual model, and many other reports; and project management for a wide variety of projects and budgets. Mr. Baumwirt's diverse background and multidisciplinary professional experience enables him to provide innovative and valuable services to a broad range of project types.

Environmental Assessment and Due Diligence Services

Mr. Baumwirt has performed more than 100 Phase I ESAs throughout the United States in accordance with ASTM standards to evaluate the presence of Recognized Environmental Conditions (RECs) associated with the subject properties. The Phase I ESAs have involved a variety of property types and proposed usages, including:

- Large remote rural properties
- Petroleum distribution facilities/pipelines
- Large-scale linear projects (mixed uses)
- Pesticide manufacturing/distribution
- Concrete and asphalt production/distribution
- Large and small agricultural properties
- Commercial wholesale and retail facilities
- Biosolids processing and composting
- Electricity generating/transmission facilities
- Residential properties
- Industrial manufacturing facilities
- Aviation/aerospace manufacturing
- Rail and transit facilities
- Mines
- Schools
- Salvage yards
- Dry cleaners
- Service stations
- Landfills and burn dumps
- Former military installations

Based on the results of Phase I ESAs, additional due diligence services have included numerous Phase II site characterizations to assess potential impacts resulting from historical activities. Activities conducted include surface geophysical surveys; asbestos and lead-based surveys and abatement; soil, soil vapor, groundwater and surface water assessments; human health risk

assessments; feasibility studies; developing estimated site cleanup costs and liability valuation; developing cleanup goals based on the current and/or future intended site usage; regulatory support and coordination; and litigation support.

Examples of the range of due diligence services provided by Mr. Baumwirt include:

Phase I Environmental Site Assessment and Phase II Site Characterization, Four Corners Generating Station, Southern California Edison

The Four Corners Generating Station (FCGS) is a coal-burning power plant located in northwestern New Mexico on land leased by the Navajo Nation. Since initiation of the plant in 1959, coal-combustion residuals have been disposed onsite and on adjoining properties. Geosyntec was contracted to perform a suite of due diligence services for the site to evaluate the potential environmental liabilities associated with the possible sale of the client's interest in the FCGS. Mr. Baumwirt managed and performed a large-scale Phase I ESA for the site in accordance with ASTM Standard E 1527-05. Due to the complex site history, large facility size, and client's planned end use of the study, the Phase I ESA report was prepared using a unique table and figure-based report format that tabulated and visualized the findings for the Site. Subsequently, Mr. Baumwirt managed and performed a comprehensive Site Characterization which included advancement of more than 70 soil borings and collection of groundwater, sediment, and surface water samples. The phase II report included a comprehensive summary of findings for the due diligence investigation and a site conceptual model based on site specific findings and historical records.

Phase I Environmental Site Assessment, 120-Mile Sunrise Powerlink, San Diego Gas & Electric

Mr. Baumwirt served as project manager and primary author of a Phase I Environmental Site Assessment to identify potential presence of contamination within the right-of-way which may affect construction, mobilize contaminants, and/or expose workers or the public for the construction of the approximately 120-mile transmission corridor. Due to the urgent nature of the project and investigation per the request of the client, Geosyntec was able to perform the site assessment and provide a draft executive summary to the client within 10 days of the site reconnaissance, and a draft Phase I ESA report within 30 days of authorization to proceed. The entire 60-square mile site assessment and final reporting was completed on schedule within 45 days. Subsequently, as additional properties were considered for purchase for the project, 42 addenda to the initial Phase I ESA were prepared on expedited schedules.

Phase II Environmental Site Assessments, 120-Mile Sunrise Powerlink, San Diego Gas & Electric

Geosyntec has performed seven expedited Phase II Environmental Site Characterizations for properties throughout the planned Sunrise Powerlink project alignment in the backcountry of San Diego County to characterize the nature and extent of existing contamination, and provide remedial cost estimates to demolish constructed features, remove contaminated materials, and restore impacted properties to their pre-developed conditions. Sites assessed have included several properties adjoining agricultural chemical manufacturing sites, former agricultural facilities, industrial facilities, and rural residences. At the request of the client, in some cases, soil

and groundwater site characterization investigations were scoped, implemented, and reported within two weeks. Additionally, due to SDG&Es observation of our outstanding project management and work product, SDG&E tasked Mr. Baumwirt to manage three other SDG&E subcontractors to coordinate the presentation of findings to the California Public Utilities Commission.

Phase II Environmental Site Assessment of Former Agricultural Lands, 120-Mile Sunrise Powerlink, San Diego Gas & Electric

During the performance of a large-scale Phase I ESA for an approximately 120-mile corridor, 24 former and current agricultural sites were identified in the subject area spanning the remote areas of San Diego and Imperial Counties. To address mitigation measures enforced by the California Public Utilities Commission (CPUC), Mr. Baumwirt managed the assessment of shallow soil at each site to evaluate the presence of organophosphate and organochlorine pesticides as a result of former agricultural site use. As required by the CPUC, Mr. Baumwirt worked with the local Agricultural Commission to prepare a Workplan to address the concerns of agency and to adequate assess the sites. To reduce costs to the client and to construct statistically valid data sets for the sites of variable sizes ranging from less than one acre to more than 100 acres, Geosyntec utilized statistical methods to determine the minimum amount of sample points necessary to be considered representative. Field sampling and reporting was completed in less than three weeks, and the project was completed ahead of schedule and under budget.

Mineral Remoteness Evaluations, Mitigation Properties, San Diego Gas & Electric

To address requirements related to environmental permits for major capital improvement projects, SDG&E acquired a number of rural open space properties for donation to various conservation agencies. To establish conservation easements on these properties, Geosyntec performed mineral remoteness evaluations for five rural properties to address potential conflicts related to severed estates, where mineral rights and surface estates for a given property are reserved separately on the property's title. The purpose of the mineral remoteness evaluations was to determine if the probability of future implementation of mining activities at the surface of the site is so remote as to be considered negligible. The five evaluations were performed on time and under budget.

Phase I and Phase II Environmental Site Assessments, Confidential Home Improvement Retailer, Various Locations

Mr. Baumwirt has assisted in conducting and reviewing over fifty Phase I ESAs for various proposed and operating home improvement retail store locations throughout the United States. Historical property uses at these sites include agricultural, rural, commercial, and industrial uses. Each Phase I ESA report was prepared in accordance with current ASTM E 1527 Standard Practice for ESAs. Mr. Baumwirt has prepared and implemented workplan's for over ten Phase II ESAs for various proposed development locations throughout California from San Diego to Crescent City. Phase II ESA investigations included soil, soil vapor, and/or groundwater sampling for recognized environmental conditions identified in previous reports and in many instances performed coordination and oversight of asbestos and lead-based paint abatement contractors. At the client's request, special coordination was often implemented to preserve the confidential nature of the investigation and/or difficult access issues.

Site Closure Assessment, Former SoilServe Facility, Wilbur-Ellis Company, Brawley, California

A retail agricultural chemical distribution facility leased an approximately 2.5-acre property for approximately 5 years. Geosyntec was contracted by WECO to perform a site closure assessment of the site after operations had ceased, to assess and document the conditions at the site prior to termination of the site lease. Mr. Baumwirt managed and performed the assessment on an expedited basis which included an initial site reconnaissance to observe site conditions and interview facility personnel, and a second phase to collect and analyze soil samples. The suite of analytical testing was specifically developed to include only chemicals of concern which were handled at the site by the client, including certain metals, chlorinated herbicides, organophosphorus compounds, fertilizer compounds, and petroleum hydrocarbons. Geosyntec delivered a concise report which clearly documented site conditions at the time the client's lease was terminated for the site.

Soil Management Planning and Monitoring, San Diego Gas & Electric.

Geosyntec previously performed a Phase I ESA for a linear project which identified several areas with likely existing soil and groundwater contamination along the proposed project's underground construction alignment. To prevent improper handling of contaminated soil and water, Mr. Baumwirt prepared a site-specific Soil Management Plan and managed the implementation of soil monitoring throughout construction in the vicinity of the previously identified areas of concern. Implementation included coordination with numerous construction contractors, identifying and screening impacted soil in the field, ensuring proper waste characterization, documenting field activities, and providing safety instruction to crews.

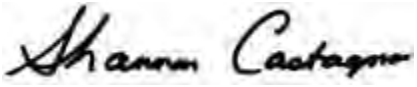
Attention: Doug Baumwirt

Dear Mr. Baumwirt

Attached is the Environmental (Hazardous/Toxic Waste) Records Search Summary of the Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., APN 451-690-18-00 ("San Diego") site located in San Diego, California. Environmental Support Services ("**ESS**") received the request on March 24, 2014 (See Appendix A). Should you have any questions regarding the summary, please call.

Sincerely,
Environmental Support Services



Shannon Castagno
Project Manager

Records Search Summary

Company:	Geosyntec Consultants
Project Name:	San Diego
Attention:	Doug Baumwirt
Street Address of Property:	Southwest Corner of Vine Street & Kettner Blvd. 3548 & 3550 Kettner Blvd. San Diego, CA APN 451-690-18-00

San Diego County Hazardous Materials Management Division

E-mailed request: 3-24-14 & 3-28-14, Contact: Joyce Ellman

ESS submitted a request for a records search concerning the San Diego site to Ms. Ellman, with the San Diego County Hazardous Materials Management Division (See Appendix B). **ESS** requested information concerning the utilization, manufacture, storage and/or discharge of hazardous materials/waste, and any information concerning previous or on-going site investigations/remediations pertaining to hazardous materials/waste. She informed **ESS** March 27, 2014 that her department did have records for APN 451-690-18-00, San Diego, CA (See Appendix B). As of April 4, 2014 Ms. Ellman had not completed **ESS'** request for 3548 & 3550 Kettner Blvd., San Diego, CA. Should any information concerning the site surface, **ESS** will immediately forward it to Mr. Baumwirt at the Geosyntec Consultants office.

United States Environmental Protection Agency – Region IX

On-line request: 3-24-14 & 3-28-14, Contact: Ivry Johnson

ESS requested that Ms. Johnson, with the United States Environmental Protection Agency – Region IX, check her records for any files/information (such as treatment, storage and disposal of hazardous waste) concerning Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00. She informed **ESS** on March 25, 2014 & March 28, 2014 that her department received **ESS'** Freedom of Information request and will respond within (20) working days (See Appendix C). Should any information concerning the site surface, **ESS** will immediately forward it to Mr. Baumwirt at the Geosyntec Consultants' office.

Department of Toxic Substances Control (DTSC) – Cypress Office

Faxed request: 3-24-14 & 3-28-14, Contact: Julie Johnson/Jone Barrio

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that Ms. Johnson/Ms. Barrio, with the DTSC, check the file room records for any files/information the concerning Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00 (See Appendix D). She informed **ESS** on March 25, 2014 & April 1, 2014 that her department had no files/information concerning that site (See Appendix D).

Department of Toxic Substances Control (DTSC) – San Diego Office

E-mailed request: 3-24-14 & 3-28-14, Contact: Cleo Munoz

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that the Records Section, with the DTSC, check the file room records for any files/information concerning the Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00 (See Appendix E). He informed **ESS** April 1, 2014 that his department had no files/information concerning that site (See Appendix E).

San Diego Fire Department – Fire Prevention

Mailed request: 3-24-14 & 3-28-14, Contact: Beth Carroll

ESS requested that Ms. Carroll, with the San Diego Fire Department, check her records concerning the storage of hazardous materials/waste and underground storage tanks with regards to the following: 3548 & 3550 Kettner Blvd., San Diego, CA (See Appendix F). As of April 4, 2014 Ms. Carroll had not completed **ESS'** request. Should any information concerning the site surface, **ESS** will immediately forward it to Mr. Baumwirt at the Geosyntec Consultants office.

City of San Diego – Industrial Waste Program

Faxed request: 3-24-14 & 3-28-14, Contact: Public Records Unit

ESS requested that the Public Records Unit, with the City of San Diego – Industrial Waste Program, check their records for any information concerning industrial waste discharge permits or violations for Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00 (See Appendix G). Brian Taylor, with that department informed **ESS** March 25, 2014 that his department had no records for APN 451-690-18-00, San Diego, CA (See Appendix G). As of April 4, 2014 Mr. Taylor had not completed **ESS'** request for 3548 & 3550 Kettner Blvd., San Diego, CA. Should any information concerning the site surface, **ESS** will immediately forward it to Mr. Baumwirt at the Geosyntec Consultants office.

San Diego Building Department

Visited: 3-25-14 & 4-4-14, Contact: Stacey Harris & Lorena Grijalva

ESS requested that Ms. Harris and Ms. Grijalva, with the San Diego Building Department, provide the building records (all building permits and certificates of occupancy) 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00. Ms. Harris informed **ESS** that her department had no records for APN 451-690-18-00, San Diego, CA. Ms. Grijalva, with that department informed **ESS** that her department only had records for 3550 Kettner Blvd., San Diego, CA (See Appendix H for copies). No further information concerning the site was obtained from the building department at the time of the investigation.

San Diego Air Pollution Control District (SDAPCD)

E-mailed request: 3-24-14 & 3-28-14, Contact: Teresa Cain

ESS submitted a search request concerning active, inactive and sold files for Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA and APN 451-690-18-00 to Ms. Cain at the SDAPCD (See Appendix I). She informed **ESS** April 4, 2014 that her department had no records for 3548 & 3550 Kettner Blvd., San Diego, CA.

Regional Water Quality Control Board (RWQCB) – San Diego Region

E-mailed request: 3-24-14 & 3-28-14, Contact: Public Records Unit

ESS requested that the Public Records Unit, with the RWQCB, provide the files for Southwest Corner of Vine Street & Kettner Blvd., 3548 & 3550 Kettner Blvd., San Diego, CA (See Appendix J). Rachel O'Donovan, with that department informed **ESS** April 1, 2014 that their department had no records for 3548 & 3550 Kettner Blvd., San Diego, CA (See Appendix J).

Records Search completed by:

Shannon Castagno
Project Manager
Environmental Support Services

The information provided in this report was obtained by a comprehensive examination of public records, public information and public servant communications. The degree of care performed by **ESS** is equivalent to that exercised by environmental companies performing similar records searches.

Sent: Friday, March 28, 2014 12:06 PM
To: Shannon Castagno (Shannon@EnvironmentalSupportServices.com)
Subject: RE: File Review Requests - Vine Street, San Diego, Ca

Hi Shannon,
We got our EDR report for the above-referenced site that has a former gas station listed at the site with an address of 3550 Kettner Blvd. Hopefully that helps with the file requests, since I know that some agencies cant search without an address.
Happy Friday!!!!
-doug

Subject: File Review Requests - Vine Street, San Diego, Ca

Hi Shannon,
Please initiate a file review for a Phase I ESA for the property located on the southwest corner of the intersection Vine Street and Kettner Bouelvard in San Diego, CA. There is no known formal address (currently a parking lot), but the SD County APN is 451-690-1800.
Please contact the following agencies:

* USEPA

* DTSC

* RWQCB

* SD APCD

* SD DEH (SAM and HMMD)

* SD Fire Dept

* SD Industrial Wastewater Control Program

* SD Building Dept

Please submit your report with whatever responses you have on Wednesday April 2nd.
Please let me know if you have any questions, or concerns, and please confirm that you can take this on.
Thank you!
-Doug

MONITORING WELL PROGRAM
GEOTECHNICAL BORING CONSTRUCTION PERMIT

SITE NAME: SAN DIEGO GAS AND ELECTRIC PROPERTY

SITE ADDRESS: SW OF KETTNER BLVD AND VINE ST., SAN DIEGO CA 92101

PERMIT FOR: **FIVE GEOTECHNICAL BORINGS**

PERMIT APPROVAL DATE: JULY 3, 2013

PERMIT EXPIRES ON: OCTOBER 31, 2013

RESPONSIBLE PARTY: SAN DIEGO GAS & ELECTRIC

PERMIT CONDITIONS:

1. All borings must be sealed from the bottom of the boring to the ground surface with an approved sealing material as specified in California Well Standards Bulletin 74-90, Part III, Section 19.D. **Drill cuttings are not an acceptable fill material.**

2. All borings must be properly destroyed within 24 hours of drilling.

3. Placement of any sealing material at a depth greater than 30 feet must be done using the tremie method.

4. This work is not connected to any known unauthorized release of hazardous substances. Any contamination found in the course of drilling and sampling must be reported to DEH. All water and soil resulting from the activities covered by this permit must be managed, stored and disposed of as specified in the SAM Manual in Section 5, II, E- 4. (**http://www.sdcounty.ca.gov/deh/lwq/sam/manual_guidelines.html**). In addition, drill cuttings must be properly handled and disposed in compliance with the Stormwater Best Management Practices of the local jurisdiction.

5. Within 60 days of completing work, submit a well/boring construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

6. **This office must be given 48-hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact the Well Permit Desk at (858) 505-6688.**

PROPERTY OWNER CONSENT

Proposed locations for subsurface work:

Property Address:	**Assessor's Parcel Number (APN):**
Southwest of the Intersection of Kettner Blvd. and Vine Street	4516901800
_____	_____

I, San Diego Gas & Electric Company, owner of the property/properties listed above, give my permission to Geosyntec Consultants (consulting company, contractor) to conduct the following work at the locations stated above.

☐ Install _____ monitoring wells ☐ Destroy _____ monitoring wells ☒ Drill 5 soil borings

I understand that Jennifer Nevius (registered professional) of Geosyntec Consultants (consulting company) and an authorized signer for Tri-County Drilling (drilling company) have submitted a signed application to the Department of Environmental Health in which they have agreed to complete the above-stated work according the requirements of the current SAM Manual, all ordinances and laws of the County of San Diego and the State of California pertaining to well/boring construction and destruction. I have arranged with the Responsible Party, the person who causes to have monitoring wells/borings installed or existing wells destroyed on this property, to ensure proper closure of the monitoring wells/borings.

PROPERTY OWNER CONSENT

Proposed locations for subsurface work:

Property Address:	**Assessor's Parcel Number (APN):**
Southwest of the Intersection of Kettner Blvd. and Vine Street	4516901800

I, San Diego Gas & Electric Company, owner of the property/properties listed above, give my permission to Geosyntec Consultants (consulting company, contractor) to conduct the following work at the locations stated above.

☐ Install _____ monitoring wells ☐ Destroy _____ monitoring wells ☒ Drill 29 CPT Soundings/ soil borings

I understand that Jennifer Nevius (registered professional) of Geosyntec Consultants (consulting company) and an authorized signer for Kehoe Testing and Engineering, Inc. (drilling company) have submitted a signed application to the Department of Environmental Health in which they have agreed to complete the above-stated work according the requirements of the current SAM Manual, all ordinances and laws of the County of San Diego and the State of California pertaining to well/boring construction and destruction. I have arranged with the Responsible Party, the person who causes to have monitoring wells/borings installed or existing wells destroyed on this property, to ensure proper closure of the monitoring wells/borings.

Dear Ms. Castagno:

The Department of Toxic Substances Control has received your letter to review records under the Public Records Act.

After a thorough review of our files we have found that no such records exist at this office pertaining to the site/facility referenced above.

We would like to inform you about EnviroStor, a database that provides information and documents on over 5,000 DTSC cleanup sites. EnviroStor can be accesses at: http://www.envirostor.dtsc.ca.gov/public. Also, a computer is available at each DTSC Regional File Room Office for use by community members to view EnviroStor.

If you have any questions or would like further information regarding your request, please contact me at (714) 484-5337.

Sincerely,

LICENSED CONTRACTORS DECLARATION: I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.
Contractor: Commercial Electric Co Jerrell Jackson

OWNER-BUILDER DECLARATION: I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5 Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for the permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.)

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.)

☐ I am exempt under Sec.

Owner

WORKER'S COMPENSATION DECLARATION
I hereby affirm that I have a certificate of Workers' compensation or a certificate of consent to self-insure for Workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.
My Workers' Compensation insurance carrier and policy number are:

SAN DIEGO AIR POLLUTION CONTROL DISTRICT

REQUEST FOR PUBLIC RECORDS

Date: 3/24/14

Name: Shannon Castagno Shannon@EnvironmentalSupportServices.com

Agency: Environmental Support Services

Address: 30251 Golden Lantern #E-305

City: Laguna Niguel State: CA Zip: 92677

Phone: (949) 429-3564 Fax: (949) 429-3563

I request to inspect the following Public Records (please be specific):

I would like copies of any permits to operate, equipment lists, notice of violations and notice to comply for:

Southwest Corner of Vine St. & Kettner Blvd.
San Diego, CA 92101
APN 451-690-1800
(See Attached Map)

INSPECTION OF PUBLIC RECORDS

The district shall make a determination if the records requested are available with the exception of those records specifically exempted from disclosure by state law and those records labeled as "TRADE SECRET" which are not emission data, within ten (10) days of the date of the receipt of the request. If, for good cause, the determination cannot be made within the ten (10) working days, the District will notify the requesting person the reasons for the delay and when the determination is expected to be made within an additional 14 days, as prescribed by law. Those records labeled as "TRADE SECRETS" shall be governed by the procedure set forth in District Rule 177 Section (g).

If you have any questions, please contact Public Records at (858) 586-2618.

Mail or fax completed form to:

Hi Rachel,

I just found two old addresses for the APN 451-690-1800, they are 3548 & 3550 Kettner Blvd., San Diego, CA 92101. I found them in the records I received from The San Diego County HMMD. I hope this helps and please let me know if you have any questions. Have a wonderful weekend J

Hi Rachel,

We don't have a physical address for the site. It is currently a parking lot and was previously a gas station in the 1970's. If I come up with an address, I will get back with you. Thanks J

Former Baron Blakeslee Facility South Parcel
3596 California Street
San Diego, CA 92101
San Diego County Assessor's Parcel No. 451-690-57
Department of Toxic Substances Control Site Code: 400208

This Covenant and Agreement ("Covenant") is made by and between Linda Ann Weir, Verna Gail Riley and Leslie Jo Bauman, Successor Co-Trustees of the Thomas O. Bateman and Ivarene Cornelius Bateman Trust dated July 10, 1968 (the "Covenantor"), and the California Department of Toxic Substances Control (the "Department"). Covenantor is the current owner of certain real property situated at 3596 California Street, San Diego, County of San Diego, State of California, described in Exhibit A, Legal Description of property, which is attached hereto and incorporated by this reference (the "Property"). Pursuant to Civil Code section 1471, the Department has determined that this Covenant is reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the Property of hazardous materials as defined in Health and Safety Code section 25260. The Covenantor and the Department, collectively referred to as the "Parties",

hereby agree that the use of the Property be restricted as set forth in this Covenant and the Parties further agree that the Covenant shall conform to the requirements of Civil Code section 1471, Health and Safety Code section 25202.5, and California Code of Regulations, title 22, section 67391.1.

ARTICLE I

STATEMENT OF FACTS

1.1. The Property is a roughly triangular parcel of land, covering approximately 0.592 acres, and is more particularly described and depicted in Exhibit "B" – Property Plot Plan. The Property is also identified as San Diego County Assessor Parcel Number 451-690-57. The Property consists of a limited part of the area generally bounded by California Street to the northeast, Bean Street to the northwest and land owned by the San Diego Metropolitan Transit System to the southwest. The Property is zoned for industrial use and is surrounded primarily by commercial and light industrial operations. The Property was formerly improved with an office and warehouse that were demolished in July 2008. Covenantor acquired ownership of the Property in 2003. Covenantor and prior owners leased the Property to the facility operators identified below.

1.2. The Property was the location of a virgin chemical sale business operated by T. O. Bateman Chemical Sales Corporation ("Bateman Chemical"). In 1969, Purex Corporation, Ltd. ("Purex") purchased Bateman Chemical and Bateman Chemical subsequently merged into Purex. In 1982, Purex transferred operation of the facility to an affiliate, Baron-Blakeslee, Inc.("BBI"). In 1985, Allied Signal, Inc. ("Allied") purchased BBI and BBI subsequently merged into Allied.

1.3. From December 1969 through 1993, the Property operated as an industrial waste management facility that stored, treated, and recycled waste solvents for refining by distillation or disposal. The facility acted as a distribution facility for the sale of virgin and re-refined chlorinated and fluorinated solvents stored in containers and bulk tanks. Solvents were blended, packaged, and delivered offsite by truck. In addition, spent chemical solvents generated offsite were accepted, stored, and recycled onsite for resale using a distillation unit. These wastes were stored in 55-gallon drums or portable tote tanks. From 1972 to 1988, facility operations also included the handling of acids.

1.4. Purex/BBI operated a hazardous waste facility pursuant to a grant of Interim Status on April 6, 1981 issued by the California Department of Health Services, the Department's predecessor agency. The Department issued a Hazardous Waste Facility Permit to BBI in September 1992.

1.5. In 1993, Allied /BBI ceased its operations and implemented the Closure Plan in the 1992 Hazardous Waste Facility Permit. Allied/BBI submitted a Closure Certification Report to the Department on July 1, 1994. The Department acknowledged the Closure Certification for the Distillation Unit Area and the Storm/Wash Water Tank Area on October 31, 1994. In 1999, Allied/BBI merged into Honeywell International, Inc. ("Honeywell").

1.6. From 1993 through 2005, Allied /BBI and Honeywell conducted a Corrective Action RCRA Facility Investigation ("RFI") of the Property. The RFI confirmed that contaminated soil at three locations exceeded the human-health-risk-based cleanup levels. In 1995, Allied /BBI excavated the soil that was above the cleanup levels as part of the Department-approved Interim Measures. Soil vapor sampling conducted in 2004 and 2005 and an indoor air risk evaluation conducted in

2008 revealed concentrations of tetrachloroethylene and trichloroethylene in soil vapor in excess of human-health-risk-based standards for indoor air in portions of the surface soil and subsurface soil within 10 feet of the surface of the Property.

1.7. There are no enclosed structures currently located on the Property. Based on the risk assessment conducted for the Property and the corrective measures undertaken to date, the Department has concluded that use of the Property as a residence, hospital, school for persons under the age of 21 or day care center would entail an unacceptable human health risk. The Department has further concluded that the Property, as remediated, and subject to the restrictions of this Covenant, does not present an unacceptable threat to human health or safety or the environment.

ARTICLE II

DEFINITIONS

2.1. Department. "Department" shall mean the California Department of Toxic Substances Control and shall include its successor agencies, if any.

2.2. Environmental Restrictions. "Environmental Restrictions" means all protective provisions, covenants, restrictions, prohibitions, and terms and conditions as set forth in any section of this Covenant.

2.3. Improvements. "Improvements" includes, but is not limited to: buildings, structures, roads, driveways, improved parking areas, wells, pipelines, or other utilities.

2.4. Lease. "Lease" means lease, rental agreement, or any other document that creates a right to use or occupy any portion of the Property.

2.5. Owner. "Owner" shall mean the Covenantor, its successors in interest, and their successors in interest, including heirs and assigns, who at any time hold fee title to all or any portion of the Property.

2.6. Occupant. "Occupant" shall mean Owners and any person or entity entitled by ownership, leasehold, or other legal relationship to the right to occupy any portion of the Property.

ARTICLE III

GENERAL PROVISIONS

3.1. Runs with the Land. This Covenant sets forth Environmental Restrictions that apply to and encumber the Property and every portion thereof no matter how it is improved, held, used, occupied, leased, sold, hypothecated, encumbered, or conveyed. This Covenant: (a) runs with the land pursuant to Health and Safety Code section 25202.5, Civil Code section 1471 and California Code of Regulations, title 22, section 67391.1; (b) inures to the benefit of and passes with each and every portion of the Property; (c) is for the benefit of, and is enforceable by the Department; and (d) is imposed upon the entire Property unless expressly stated as applicable only to a specific portion thereof.

3.2. Binding upon Owners/Occupants. Pursuant to Health and Safety Code section 25202.5, Civil Code section 1471 and California Code of Regulations, title 22, section 67391.1, this Covenant binds all owners of the Property, their heirs, successors, and assignees, and the agents, employees, and lessees of the owners, heirs, successors, and assignees. Pursuant to Civil Code section 1471, all successive owners of the Property are expressly bound hereby for the benefit of the Department. It is intended that this Covenant binds all Owners and Occupants, and their respective successors and assigns, only during and with respect to their respective successive periods of ownership or occupancy such that an Owner's or Occupant's rights and obligations under this Covenant shall terminate upon transfer, expiration, or termination

of the Owner's or Occupant's interest in the Property, except that such Owner's or Occupant's liability for any violations of the requirements or restrictions of this Covenant or any acts or omissions during such ownership or occupancy shall survive any transfer, expiration or termination of the Owner's or Occupant's interest in the Property.

3.3. Incorporation into Deeds and Leases. This Covenant shall be incorporated by reference in each and every deed and Lease for any portion of the Property.

3.4. Conveyance of Property. The Owner shall provide written notice to the Department not later than thirty (30) days after any conveyance of any ownership interest in the Property (excluding Leases, and mortgages, liens, and other non-possessory encumbrances). The written notice shall include the name and mailing address of the new owner of the Property and shall reference the site name and site code as listed on page one of this Covenant. The notice shall also include the Assessor's Parcel Number (APN) noted on page one. If the new owner's property has been assigned a different APN, each such APN that covers the Property must be provided. The Department shall not, by reason of this Covenant, have authority to approve, disapprove, or otherwise affect the proposed conveyance, except as otherwise provided by law or by administrative order.

3.5. Costs of Administering and Enforcing the Covenant.

The Department will incur costs associated with the implementation, administration and enforcement of this Covenant. Therefore, the Covenantor hereby covenants for the Covenantor and for all subsequent Owners that, pursuant to California Code of Regulations, title 22, section 67391.1(h), the Owner agrees to pay the Department's costs in implementing, administering and enforcing the Covenant except for costs that

Honeywell agrees to pay under the Land Use Covenant Implementation and Enforcement Agreement entered into between DTSC and Honeywell, a copy of which is attached hereto as Exhibit C. In the event that Honeywell fails to comply with the terms of the Land Use Covenant Implementation and Enforcement Agreement, the Owner shall pay the Department's costs incurred in implementing, administering and enforcing this Covenant pursuant to California Code of Regulations, title 22, section 67391.1(h).

ARTICLE IV

RESTRICTIONS AND REQUIREMENTS

4.1. Prohibited Uses. The use of the Property shall be restricted for commercial and industrial purposes only. The Property shall not be used for any of the following purposes:

(a) A residence, including any mobile home or factory-built housing, constructed or installed for use as residential human habitation.

(b) A hospital for humans.

(c) A public or private school for persons under 21 years of age.

(d) A day care center for children.

4.2. Soil Management

(a) Activities that will disturb the soil, such as excavation, grading, removal, trenching, filling, earth movement or mining, shall only be permitted on the Property pursuant to a Soil Management Plan and a Health and Safety Plan as approved by the Department.

(b) Any contaminated soil brought to the surface by grading, excavation, trenching, or backfilling shall be managed in accordance with all applicable

provisions of state and federal laws.

4.3. Future Buildings.

No new buildings may be allowed on the Property unless there are Department-approved engineering controls, such as increased ventilation, thicker foundations and/or vapor barrier linings, to prevent potential indoor exposure to volatile organic compounds. For the purpose of this Section 4.3, the term "building" does not include roofed structures without walls, and Section 4.3 shall not apply to the construction of such structures.

4.4. Prohibited Activities. The following activities shall not be conducted at the Property:

(a) Raising of cattle, food crops or agricultural products.

(b) Drilling for drinking water, oil, or gas.

(c) Extraction of ground water for purposes other than the Department-approved groundwater monitoring or site remediation activities.

(d) Any activity that may interfere with the performance of any site investigation or remediation activities.

4.5. Access for Department. The Covenantor agrees that the Department shall have reasonable right of entry and access to the Property for inspection, monitoring, and other activities consistent with the purposes of this Covenant as deemed necessary by the Department in order to protect public health and safety or the environment.

4.6. Access for Implementing Operation and Maintenance Activities.

The Covenantor agrees that the entity or person responsible for implementing any operation and maintenance activities shall have reasonable right of entry and access to the Property for the purpose of implementing such operation and

maintenance activities until such time as the Department determines that no further operation and maintenance activities are required.

4.7. Inspection and Reporting Requirements.

The Owner shall conduct an annual inspection of the Property verifying compliance with this Covenant, and shall submit an annual report to the Department by January 15 of each calendar year. The annual report must include the dates, times, and names of those who conducted and reviewed the annual inspection. It also shall describe how the observations were performed and the basis for the statements and conclusions in the annual report (e.g., drive-by, walk-in, etc.). If violations of this Covenant are noted by the observer, the annual report must detail the steps taken to return to compliance. If the Owner identifies any violations of this Covenant during the annual inspections or at any other time, the Owner must within 10 days of identifying the violation, determine the identity of the party in violation, send a letter advising the party of the violation of this Covenant and demand that the violation cease immediately. Additionally, copies of any correspondence related to the enforcement of the Covenant shall be sent to the Department within 10 days of its original transmission.

ARTICLE V

ENFORCEMENT

5.1. Enforcement. Failure of the Owner or Occupant to comply with this Covenant shall be grounds for the Department to require modification or removal of any Improvements constructed or placed upon any portion of the Property in violation of this Covenant. Violation of this Covenant, including but not limited to, failure to submit, or the submission of any false statement, record or report to the Department, shall be grounds for the Department to pursue administrative, civil, or criminal actions, as

provided by law.

ARTICLE VI

VARIANCE, TERMINATION, AND TERM

6.1. Variance. The Owner, or any other aggrieved person, may apply to the Department for a written variance from the provisions of this Covenant. Such application and any response thereto by the Department shall be made in accordance with Health and Safety Code sections 25202.6 and/or 25233.

6.2. Termination or Partial Termination. The Owner, or any other aggrieved person, may apply to the Department for a termination or partial termination of one or more terms of this Covenant as they apply to all or any portion of the Property. Such application and any response thereto by the Department shall be made in accordance with Health and Safety Code sections 25202.6 and/or 25234.

6.3. Term. Unless ended in accordance with paragraph 6.2 above, by law, or by the Department in the exercise of its discretion, this Covenant shall continue in effect in perpetuity.

ARTICLE VII

MISCELLANEOUS

7.1. No Taking or Dedication Intended. Nothing set forth in this Covenant shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Property, or any portion thereof to the general public or anyone else for any purpose whatsoever. Further, nothing set forth in this Covenant shall be construed to effect a taking under federal or state law.

7.2. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in San Diego County within ten (10) days of the Covenantor's

receipt of a fully executed original.

7.3. Notices. Whenever any person gives or serves any notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (a) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (b) three business days after deposit in the mail, if mailed by United States mail, postage paid, certified, return receipt requested:

To Owner:

Covenantor: Linda Ann Weir, Successor Co-Trustee
5715 Baltimore Drive, No. 141
La Mesa, California 91942

With a Required Copy to:

R. Gordon Huckins, Esq.
Fox Johns Lazar Pekin & Wexler
525 B Street, Suite 1500
San Diego CA 92101

Or: (Name and address of any new owner as identified to the Department pursuant to Section 3.4 of this Covenant)

To Department: Department of Toxic Substances Control
5796 Corporate Avenue
Cypress, California 90630
Attention: Project Manager

The Owner shall immediately forward any notice to the Occupant(s) if the Occupant(s) are affected by such notice. Any party may change its address or the individual to whose attention a notice is to be sent by giving written notice in compliance with this paragraph.

7.4. Partial Invalidity. If any portion of the Environmental Restrictions or other terms set forth herein is determined by a court of competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect

as if such portion found invalid had not been included herein.

7.5. Statutory References. All statutory references include successor provisions.

7.6. Incorporation of Attachments. All attachments and exhibits to this Covenant are incorporated herein by reference.

PROPERTY PLOT PLAN

EXHIBIT C

In the matter of: Former Baron Blakeslee Facility- South Parcel 3596 California Street San Diego, CA 92101 County of San Diego APN 451-690-57	)	LAND USE COVENANT IMPLEMENTATION AND ENFORCEMENT AGREEMENT Civil Code section 1471; Health and Safety Code section 25202.5; California Code of Regulations, title 22, section 67391.1

The California Department of Toxic Substances Control ("Department") and Honeywell International, Inc. ("Honeywell") enter into this Land Use Covenant Implementation and Enforcement Agreement ("Agreement") and agree as follows:

1. Land Use Covenant. The Department and Linda Ann Weir, Verna Gail Riley and Leslie Jo Bauman, Successor Co-Trustees of the Thomas O. Bateman and Ivarene Cornelius Bateman Trust dated July 10, 1968 ("Successor Co-Trustees") entered into a Covenant to Restrict Use of Property (also known as Land Use Covenant or "LUC") for the Former Baron Blakeslee Facility – South Parcel, located at 3596 California Street, San Diego, CA 92101 (the "Property") as part of the Corrective Measures Remedy approved by the Department for the Property. The Property is currently owned by Successor Co-Trustees. The Property is generally described as County of San Diego Assessor Parcel Number 451-690-57.

2. Reimbursement of Department's Costs. The Department may incur costs associated with the implementation, enforcement and administration of the LUC such as costs to be incurred in reviewing the Soil Management Plans or Health and Safety Plans required by Paragraph 4.2 of the LUC, or the annual inspection reports required by Paragraph 4.7 of the LUC. Pursuant to California Code of Regulations, title 22, section 67391.1(h), Honeywell agrees to reimburse the Department for its costs incurred in implementing, enforcing and administering the Land Use Covenant except that Honeywell will not pay for the Department's costs incurred solely for taking enforcement actions to address any violations of the LUC for which Honeywell or its employees or agents are not responsible. Honeywell agrees to make the payment within 30 days of

receipt of the Department's billing by check payable to the "Department of Toxic Substances Control", and bearing on its face the Site Code "400208".. Payments shall be sent to: Department of Toxic Substances Control, Accounting Office, P. O. Box 806, Sacramento, California 95812-0806. A photocopy of the check shall be sent concurrently to the Department's Project Manager. The Department shall retain all cost records associated with the work conducted under this Agreement as may be required by state law. The Department will make all documents that support the Department's cost determination available for inspection upon request in accordance with the Public Records Act, Government Code section 6250 et seq. Nothing in this paragraph bars Honeywell from seeking a remedy in any court of competent jurisdiction against any third party who may have caused or contributed to a violation of the LUC, including, but not limited to, an action to recover costs which Honeywell has paid to the Department pursuant to this paragraph.

3. Financial Assurance. Honeywell must assure that sufficient funds are available to implement all the requirements of this Agreement and to pay DTSC's costs as specified in Paragraph 2 of this Agreement. Honeywell has established an Irrevocable Standby Letter of Credit (No. 004657202) issued by Mizuho Corporate Bank (USA) for the amount of $30,000 as the financial assurance mechanism that meets DTSC's requirements.

4. Project Managers. For the purposes of implementing this Agreement, Mr. Tao Wu will serve as Honeywell's Project Manager and Ms. Christine Brown will serve as the Department's Project Manager. The Department and Honeywell shall promptly notify each other of any change in the identity of the Project Manager. Notices, submittals and other communications between the Department and Honeywell shall be sent to:

To: Department of Toxic Substances Control
Department of Toxic Substances Control
5796 Cypress Avenue
Cypress, CA 90630
Attention: Project Manager

To: Honeywell International, Inc.
Attention: Mr. Tao Wu
Health, Safety and Environmental Engines, Systems & Services

P.O. Box 52181
Phoenix, AZ 85072

5. Parties Bound. This Agreement applies to and is binding upon Honeywell and its officers, directors, agents, employees, contractors, consultants, receivers, trustees, successors and assignees, including but not limited to individuals, partners, and subsidiary and parent corporations, and upon the Department and any successor agency of the State of California that may have responsibility for and jurisdiction over the subject matter of this Agreement.

6. Effective Date. The effective date of this Agreement is the date of signature by the Department's authorized representative.

7. Representative Authority. Each undersigned representative of the parties to this Agreement certifies that she or he is fully authorized to enter into the terms and conditions of this Agreement and to execute and legally bind the parties to this Agreement.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there are 3 CERC-NFRAP sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/10/2013 has revealed that there are 3 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 09/10/2013 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 09/10/2013 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

HONEYWELL INC	***3596 CALIFORNIA ST***	***NW 0 - 1/8 (0.080 mi.)***	***F30***	***60***

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/10/2013 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 02/03/2014 has revealed that there are 20 CA ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

State and tribal leaking storage tank lists

CA LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the CA LUST list, as provided by EDR, and dated 12/16/2013 has revealed that there are 27 CA LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, and dated 12/16/2013 has revealed that there are 2 CA UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/10/2013 has revealed that there are 5 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 26 EDR US Hist Auto Stat sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 7 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code:	D001

CHEVRON STATION 93509 (Continued) **1000820401**

Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Violation Status: No violations found

FINDS:

Registry ID: 110002896377

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET,

HONEYWELL INC (Continued) **1000338187**

WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D039
Waste name: TETRACHLOROETHYLENE

Waste code: D040
Waste name: TRICHLOROETHYLENE

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

File Location:	Local Agency
Potential Media Affect:	Not reported
Potential Contaminants of Concern:	Not reported
Site History:	On October 1, 2010, an underground storage tank (UST) closure inspection was conducted at the site. The UST (approximately 500 gallons in capacity) was discovered during site construction and was already removed from the ground and placed on-site next to the original UST excavation pit. A plot map was provided to the Department of Environmental Health (DEH) with the UST closure permit application that identified the locations of the UST and the excavation. However, prior to the start of the inspection, DEH staff observed the removed UST at a different location than what the plot map showed, and the excavation was not apparent. The original excavation was compromised by grading and foundation construction. DEH staff was unable to complete the required soil sampling because the former location of the UST within the excavation was indeterminable, the soil surrounding the excavation had been removed, and the excavated soil stockpile could not be verified. Therefore, due to potential soil contamination, DEH opened Unauthorized Release Case #212781-001. An UST Removal Report completed by H.M. Pitt Labs, Inc. and dated January 20, 2011 was review by DEH staff. The approximate volume of the stockpiled impacted soil was estimated at one (1) cubic yard. Six (6) soil samples (1 sample from the stockpile and 5 samples from the UST excavation) where collected and analyzed for TPH, VOCs, and lead. TPH of up to 77.1 mg/kg and lead at 25.7 mg/kg were detected from the one sample of the stockpile. All five samples from the UST excavation tested non-detect (ND) for TPH, VOCs, and lead. The stockpiled soil was buried immediately beneath the asphalt paving (total depth of approximately 1-foot below the ground surface) of the parking space for Unit #15. The site is located in an area that has been designated as having no beneficial groundwater uses. Groundwater ranges to an estimated depth of 58 to 61 feet. The consultant concludes any impacted soils associated with the former UST have been excavated, stockpiled, and used on-site. In addition, any in situ soil remaining does not appear to have been impacted. The consultant recommends closure of this case and the DEH concurs with their recommendation.

Local Agency:	Not reported
RB Case Number:	4090004
File Location:	Regional Board
Potential Media Affected:	Indoor Air, Other Groundwater (uses other than drinking water), Sediments, Soil, Soil Vapor, Surface water
Potential Contaminants of Concern:	Polychlorinated biphenyls (PCBs), Chromium
Site History:	This site is the former General Dynamics Conviar Division facility.

NORTHSIDE SAN DIEGO INTERNATIONAL AIRPORT REDEVELOPMENT (FOR (Continued) **S113804553**

Between 1935 and 1995, General Dynamics and its predecessors (including Consolidated Aircraft Company, Consolidated Vultee Aircraft Company and Convair) performed aircraft and aerospace manufacturing activities at the Facility. Facility decommissioning began in 1995 and ended in 1997. Chemicals of concern (COCs) used at the site included fuels, oils, solvents, paints, acids, metals, and paints. Attitudinally PCB-bearing building materials were used. Prior to plant decommissioning COCs were found in soil and groundwater. Several phases of investigations and remediation took place. During plant decommissioning remedial actions were taken when COCs were found. Recent soil and groundwater investigations encountered COCs in soil and groundwater. The San Diego Regional Airport Authority plans on redevelopment of the site to airport related businesses and is conducting additional investigations to assess the potential risk relative to the new site use.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
