Case Type:	Cleanup Program Site
Case Worker:	EP
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	Not reported
File Location:	Local Agency
Potential Media Affected:	Soil
Potential Contaminants of Concern:	Arsenic, Lead
Site History:	AMCAL Mission Fund, L.P. is redeveloping the Site into an affordable housing residential apartment complex with three levels of apartments on top of one level of subterranean parking. The residential units have been proposed to be constructed around the perimeter of the Site, with an open courtyard area in the center of the property that includes driveways for access to the parking, access for emergency vehicles, a tot lot, and an open community park space. As of March 9, 2011, the Site is currently used as a parking lot and contains one two-level commercial/office building adjacent to Hancock Street. SCS Engineers (SCS) prepared a Soil Management Plan (SMP) dated March 9, 2011, to address the potential constituents of concern (CoC) that may be encountered during the redevelopment process. The primary purpose of the SMP was to provide a methodology for the proper segregation, handling, and disposal/reuse of soil from the Site. The SMP proposed the excavation of approximately 7,800 cubic yards of soil to a subgrade elevation of approximately 23 feet above mean sea level (MSL). The SMP was approved by DEH on May 27, 2011, with a condition that two additional potholes be excavated in the approximate location of borings B11 and B12 due to the reported concentrations of lead that either did exceed or had the potential to exceed California hazardous waste criteria upon excavation and export from the Site. On June 3, 2011, DEH personnel completed a site visit and witnessed the on-site impacted soil evaluations performed by SCS, near borings B11 and B12 . On August 12, 2011, DEH concurred that SCS implemented the SMP as planned with soil mitigation measures being completed and approved the commencement of the foundation construction phase. The Property Closure Report (PCR) dated July 30, 2012 and prepared by SCS, documents the assessment of all known and suspected releases of hazardous substances/petroleum products and the mitigation of all known releases as required by the approved SMP. According to the PCR, the following is a summary of soil disposal. A total of 15,428.46 tons (approximately 9,950 cubic yards) of soil was excavated and exported off-site to different locations under the RWQCBs Conditional Waiver No. 8 for soil reuse. There were three deviations from the original SMP to the work actually completed in the PCR. On July 18, 2011, an underground storage tank (UST) was discovered in the northeast corner of the property. On August 3, 2011, the UST was

MISSION APARTMENTS (Continued) **S110770344**

closed by removal by Ace Excavating under DEH permit. A total of six soil samples were collected from below the UST and from the sides of the former UST excavation. All six samples were reported to have no detectable TPH concentrations. The excavated asphalt debris and soil was stockpiled onsite, then was characterized and disposed offsite. The samples were reported to have no detectable concentrations of VOCs, SVOCs, or PCBs. The metal concentrations were below hazardous waste criteria, and the TPH concentrations were within the waste discharge requirements for the Otay Landfill. A total of 51.94 tons of petroleum hydrocarbon-bearing soil and asphalt debris from the UST removal were disposed of at the Otay Landfill as non-hazardous waste. Approximately 150 cubic yards of olive-gray soil exhibiting an organic odor was discovered on top of a buried asphaltic concrete pad near pothole location T-B12. Six samples were collected from this stockpiled soil and analyzed for total lead by EPA Method 6010B. The samples ranged from 26.1 mg/kg to 48.1 mg/kg with an average concentration of 35.05 mg/kg. Approximately 225 tons of this soil was exported under the non-hazardous waste profile and sent off-site to the Otay Landfill. Once the Site was excavated to the subgrade, the geotechnical engineer for the project concluded that the upper 18 inches of soil below the subgrade elevation (i.e., from 21.5 to 23 feet MSL) needed to be cut and recompacted. Therefore, in tho

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Case Type: Cleanup Program Site
Case Worker: TCA
Local Agency: Not reported
RB Case Number: 2090500
File Location: Regional Board
Potential Media Affected: Soil, Surface water
Potential Contaminants of Concern: Other Acid or Corrosive, 1,1,1-Trichloroethane (TCA), Tetrachloroethylene (PCE), Trichloroethylene (TCE), Polychlorinated biphenyls (PCBs), Diesel, Gasoline, Waste Oil / Motor / Hydraulic / Lubricating, * * PCB-1248, * * PCB-1260, * Petroleum - Jet Fuel / Aviation
Site History: The 44-acre Site is located adjacent to and south of the Airport runway and is owned by the San Diego Unified Port District ("Port") and is occupied at the current time by the Airport. The Site was originally tidelands of the San Diego Harbor but was filled with materials dredged from San Diego Harbor from 1936 to 1939 during the creation of Lindbergh Field and the U.S. Coast Guard Station. The Site was initially owned by the City of San Diego as part of its airport operations. The Site was leased to the Ryan Aeronautical Company (Ryan Aeronautical) commencing on or around 1939, and was later leased toTeledyne Industries, Inc., acting by and through its Teledyne Ryan Aeronautical Division (TRA) commencing in 1984. The westernmost portion of the Site was reportedly used by the City of San Diego for its operations during the early 1940s. The Port subsequently received title for the property from the City of San Diego in the early 1960s. Ryan Aeronautical and TRA manufactured aircraft and military planes for the U.S. Government from 1939 to 1999. The business and the majority of the assets of Ryan Aeronautical were sold in 1999 to Northrop Grumman. Operations at the Site ceased in 1999 and the Port terminated TDYs lease was terminated on November 1, 2002. A detailed site use history was developed by PES Environmental (PES, 2001). The activities described in the PES report

TDY INDUSTRIES, INC. (Continued) **1000201840**

are consistent with large scale manufacturing of aircraft and aeronautical equipment. As such, various chemicals of interest were utilized onsite, including polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), petroleum fuels, and metals.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Waste code:	331
Waste name:	331
Waste code:	352
Waste name:	352
Waste code:	461
Waste name:	461
Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D005
Waste name:	BARIUM
Waste code:	D007
Waste name:	CHROMIUM

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 12/04/2013

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Most Recent Revision:	1996

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

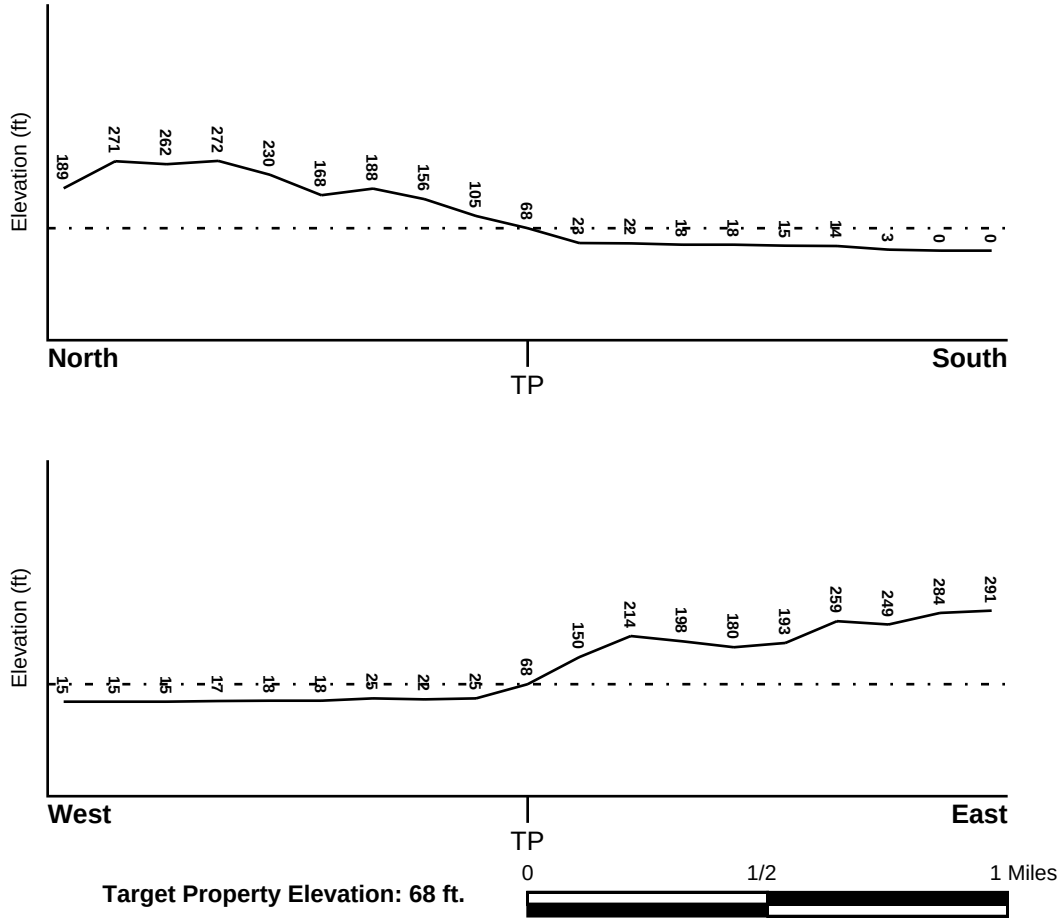
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SAN DIEGO, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06073C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
POINT LOMA	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	1/4 - 1/2 Mile NW	W
2	1/4 - 1/2 Mile SSE	Not Reported
3	1/4 - 1/2 Mile SE	Not Reported

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
10	1/2 - 1 Mile SSE	WSW
11	1/2 - 1 Mile SW	Not Reported
12	1/2 - 1 Mile SSE	Not Reported
13	1/2 - 1 Mile SSE	E

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Contact: Doug Baumwirt

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by GeoSyntec Consultants were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

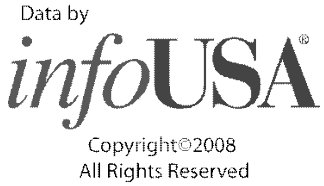
Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1903 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR is licensed to reproduce certain City Directory works. Reproduction of City Directories without permission of the publisher may be a violation of copyright.



RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

CASHIERS! CLERKS! TELLERS!
Do your employers furnish you with the latest edition of the City Directory?
You need it at your elbow at all times, to protect your company from forgers and bad-check artists. A few questions, checked against City Directory information, will trip them at once. Intelligent use of the City Directory for this purpose has saved thousands of dollars and helped make some cities "too sharp" for bad-check "operators."

Why Is There A Need for This Manual?

Sempra Energy's Environmental Policy states in part, "Sempra Energy believes in treating the Earth's resources with respect. We are committed to protecting and conserving the environment and the health and the safety of our employees, our customers, and the diverse communities in which we operate and provide service." Therefore, Sempra Energy companies will:

- Meet applicable environmental laws, regulations, and permit requirements.
- Join customers, civic leaders and other community leaders in providing sound and responsible stewardship of our environment.
- Incorporate appropriate environmental management and compliance in strategic planning and operational decisions."

Municipalities (Cities, Counties, and Special Districts) have passed storm water ordinances intended to protect storm sewer systems and receiving water bodies from sediment, chemical, and biological pollutants. These ordinances require storm water Best Management Practices (BMPs) for construction projects and construction activities that disturb soil. Due to the numerous municipalities in the San Diego Gas & Electric (SDG&E) service territory, there is a need to consolidate the various municipal BMP requirements for consistent and cost effective construction practices. This manual has been written to supplement the operational procedures of SDG&E to meet the municipal storm water ordinance requirements within SDG&E's service territory. Municipal storm water ordinances include prohibitions regarding erosion, sedimentation and discharge of other pollutants without reference to soil disturbance area and include construction "like" activities that include construction or operation and maintenance activities that can impact the municipal storm water conveyance systems. These activities include saw cutting, potholing, trenching, excavation (including trench and excavation dewatering) and stockpiling. Therefore, this BMP manual is applicable to the above construction and construction "like" activities, including field operations and maintenance activities, regardless of soil disturbance area or its location. This manual is also applicable to construction "like" activities at SDG&E facilities, such as Construction & Operations (C&O) facilities, supplementing the Facility Storm Water Management Plan (SWMP) or Storm Water Pollution Prevention Plan (SWPPP) BMPs.

Construction or demolition activities that include any land disturbance of one (1) acre or more are subject to storm water control regulations in the California Construction General Storm Water Discharge Permit (CGP) established by the California State Water Resources Control Board (SWRCB) Order No. 2009-009-DWQ. This CGP has many new requirements compared to the previous permit (Order No. 99-08-DWQ) and requires electronic submittal of the Notice of Intent (NOI), risk assessment, site map, project specific SWPPP, and annual report requirements. Projects subject to the CGP must establish a project-specific construction site risk level based on the site-specific sediment discharge risk and the site's receiving water risk. These two factors are used to determine the project risk, which is assigned as Risk Level 1, 2, or 3 for traditional (non-linear) projects or Type 1, 2, or 3 for linear underground/overhead (LUP) projects. CGP requirements are more stringent for higher Risk Levels or Types. The CGP established numeric discharge limits for turbidity and pH for Risk Level/Type 2 and 3 sites. All projects risk levels/types must implement minimum BMPs and perform visual monitoring in accordance with the CGP. In addition, the CGP has specific certification requirements for those that prepare SWPPPs (i.e., "Qualified SWPPP Developers") and those that implement requirements in the field (i.e., "Qualified SWPPP Practitioners").

The purpose is to update the manual and BMP details to reflect requirements of the new California Construction General Storm Water Discharge Permit (CGP) (California State Water Resources Control Board (SWRCB) Order No. 2009-009-DWQ), which became effective on July 1, 2010 as well as to update information related to SDG&E operations and activities.

Many of the construction activities of SDG&E are linear in nature, unique to utility work, and do not correspond to typical large development project BMPs. There is a continuing need to tailor typical BMPs to utility type work and utility work crews. This manual incorporates the above mandates of Sempra Energy's Environmental Policy. The manual is the result of surveying the available governmental, association, and industry sources of construction BMPs, and the selection and editing of BMPs appropriate to SDG&E construction activities and personnel.

A Note Regarding Impacts to Construction Cost and Scheduling

It is important for a project's or activity's budget and schedule to include BMP selection, implementation and maintenance costs and time horizons into the design and construction of a project. It is also important that there is a mechanism to hand-off the BMP portion of a project to the appropriate SDG&E Operations and Maintenance Department for final stabilization and post-project permanent BMP maintenance (including final and post-construction costs). A project's field Environmental Representative will be able to assist in estimating and incorporating these costs and scheduling considerations into the project or construction activity.

BMP PROGRAM OVERVIEW

Water Quality Construction BMP Manual

The purpose of this Water Quality Construction BMP Manual (Manual) is to provide standardized BMPs to reduce or eliminate pollutants in runoff from SDG&E construction projects and construction activities for water quality protection. This Manual applies to SDG&E's construction projects and activities that disturb soil. This manual also applies to SDG&E's contractors performing such work as part of their contractual obligations. SDG&E's service area encompasses approximately 4,000 square miles of diverse terrain from Southern Orange County to the Mexican border. Many of SDG&E's projects and work activities throughout the service area are subject to coverage under the National Pollutant Discharge Elimination System (NPDES) CGP and its conditions, and/or local municipal storm water ordinance requirements. Because of the breadth of jurisdictions and requirements that apply to SDG&E's utility construction projects and activities, this Manual has been developed to provide a consistent approach to water quality management to be applied by SDG&E and their contractors throughout the SDG&E service area.

Most construction projects performed by SDG&E are linear projects which are often short term, and are low impact on narrow corridors of land. Many of the BMPs presented in this Manual have used the best and most practical pollution prevention features from several sources, such as the SWRCB, the California Stormwater Quality Association (CASQA), local municipalities, and California Department of Transportation (Caltrans) BMP Manuals, that have been modified to integrate into our utility construction activities but are also compliant with the applicable regulations and ordinances.

This Manual is organized into three main sections:

- BMP Program Overview.
- BMP Selection and Implementation.
- BMP Details.

The BMP Details section is divided into four functional BMP categories:

- Sediment Controls.
- Waste and Materials Management Controls.
- Non-Storm Water Discharge Controls.
- Erosion Control.

Within each of these categories, specific information, including "What," "When," "Where" and "How" to implement the BMP, plus maintenance and inspection information, are provided for each BMP. Pictures and diagrams are also provided for many of the BMPs for easy reference. Photographs provided in this Manual have been primarily obtained from URS Corporation, Geosyntec Consultants, California Department of Transportation (Caltrans), CASQA, and SDG&E.

The Manual is a tool designed to assist with the identification of BMPs appropriate for use on a construction or activity site. The Manual provides guidance to SDG&E for meeting regulatory water quality requirements for utility construction and maintenance activities that involve disturbance of soil. The BMP selection process provides users with guidance for the selection of typical BMPs that may apply to standard SDG&E construction activities. During BMP selection, the users of this Manual should take into account the benefits and limitations of each of the BMPs considered in the context of the site conditions. Finally, BMP success is contingent not only on appropriate selection and implementation, but also on the coordination and communication between project management, Field Environmental Representatives, and the field construction teams.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Utility Type Projects

Most SDG&E projects are very different from commercial or residential developments, building sites, and Caltrans projects. Many SDG&E projects are smaller, short term, and impact narrow corridors of land. SDG&E projects are constantly progressing along the route. Often, SDG&E projects are in the right-of-ways of streets or along SDG&E utility corridors that must be maintained to ensure safe access to gas and electric lines and where temporary BMPs are initially installed for a short period of time during construction, followed by soil stabilization BMPs as necessary.

Training Program

Training for construction storm water pollution prevention and control is part of SDG&E's overall Water Quality Pollution Prevention Program. All applicable company employees and contractors hired by the company have the responsibility to comply with environmental laws, regulations, and permit requirements. Training for the prevention of environmental-related incidents is conducted for applicable SDG&E employees who perform any operation or activity that has the potential to cause a pollutant to be released into the environment, including construction activity. Records are maintained as to when employees have received this training and instruction.

Contractor responsibilities, including environmental training of their employees, are specified in the terms and conditions of the contract between SDG&E and the contractor.

Applicable employees should know and contact their local Field Environmental Representatives for support and guidance on any aspects of the training program.

BMP SELECTION AND IMPLEMENTATION

General Protocol BMP

To select BMPs that are appropriate for a given project, the following steps should be followed:

Step 1 – In the project's design phase, identify "Permanent" or "Structural" BMPs required by the local municipality or the CGP. These BMPs are often stated in the requirements as "Post-Construction" or "Permanent" BMPs.
Step 2 – Identify construction activities and the associated pollutants and issues of concern
Step 3 – Evaluate site conditions and select applicable BMPs
Step 4 – Implement, monitor, and maintain the BMPs

Step 1 – Identify "Permanent" or" Structural" BMPs required by Local Municipalities and/or the SWRCB General Construction Storm Water Permit.

Municipalities may have a Standard Urban Stormwater Mitigation Plan (SUSMP) or equivalent, and other requirements such as a requirement for conformance with the California Green Building Standards Code (CalGreen Code). These Plans and Codes may require:

- Permanent stabilization of exposed soil surfaces and slopes to minimize erosion and sedimentation. Stabilization structures and/or the planting of vegetation may be required.
- Matching post-construction runoff to pre-construction runoff, utilizing the 85th percentile storm event to reduce the risk of impact to the receiving water's channel morphology and provide some protection of water quality.
- Use of Low Impact Development (LID) practices. LID practices are environmentally sustainable practices that benefit water supply and contributes to water quality protection. Unlike traditional storm water management, which collects and conveys storm water runoff through storm drains, pipes, or other conveyances to a centralized storm water facility or outfall, LID takes a different approach by using site design and storm water management to maintain the site's pre-development runoff rates and volumes. LID practices include; Impervious surface reduction & disconnection; bio-retention facilities or rain gardens, grass swales and channels, vegetated rooftops, rain barrels, cisterns, vegetated filter strips, and permeable pavements.

Step 2 – Identify Activities, Pollutants, and Issues of Concern

The second step in BMP selection is to identify the construction activities, the associated potential pollutants, and the local issues of concern. Construction activities may include saw cutting, potholing, trenching, excavation, stockpiling of soil, grading and grubbing, new access road construction, paving, or other activities with the potential to impact storm water and non- storm water discharges. Pollutants of concern may include: sediment; petroleum products such as fuel, oil, and grease from vehicle and equipment operation; paving materials such as concrete and asphalt components; other materials used or stored on site, such as pesticides, herbicides, fertilizer, detergents, paint, adhesives, and solvents; and project wastes such as litter, debris, hazardous wastes, and liquid wastes. The local issues of concern may include:

- Proximity to sensitive receiving waters (environmentally sensitive areas or Clean Water Act Section 303(d) listed water bodies, particularly those meeting the criteria for "sediment sensitive" receiving waters identified in the CGP, example: Upper Newport Bay
- Local regulatory requirements influencing BMP selection, or timing of BMP implementation.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Step 3 – Evaluate Site Conditions and Select BMPs

To assist in BMP selection, this Manual presents BMPs that are anticipated to be most applicable to utility construction projects and construction activities. Most SDG&E utility projects are unique in that they are typically very short-term, low impact on narrow corridors of land, and have minimal exposure of soil or transportable materials at any one time to storm water. The selector should consider any project-specific requirements or factors such as BMP effectiveness, cost, availability, feasibility, and suitability for the site. For example, important site conditions to consider include the amount of soil disturbance, anticipated weather conditions, soil type and erodibility, flow path length, and slope of exposed soil. Selected BMPs can and should be modified to suit the scope of the project and site conditions.

Table 1 presents guidelines for BMP selection and implementation at a construction site. Table 2 presents a BMP selection worksheet for utility activities. These implementation guidelines and selection worksheet can be used to select BMPs for a specific project or construction activity. Finally, a selector may discover a better BMP for their situation not listed in Tables 1 or 2. The Environmental Services Department encourages creative and practical pollution prevention techniques. These new techniques can be shared with others to support the water quality goals of the region.

Step 4 – Implement, Monitor, and Maintain the BMP System

It is important that selected BMPs be implemented in a sequence that maximizes protection of water quality, be monitored regularly for effectiveness and be maintained as necessary throughout the project. Appropriate BMPs must be implemented year round. Additional BMPs will be implemented when needed, and/or when a storm event is forecasted or occurs. Table 1 presents a suggested schedule for BMP implementation and sequencing. Steps in this schedule should be reviewed for each project as applicable. All BMPs should be monitored and inspected regularly and particularly before and after rain events, or in compliance with the frequency specified in the CGP, if applicable. BMPs should be maintained during a project in accordance with the procedures outlined in the BMP Details Section.

BMP Installation Contractors and BMP Material Suppliers

Construction crews will implement most BMPs. This Manual identifies some SDG&E utility activities and operations that may require outside contractors to install the applicable BMPs. As needed, please consult with the Environmental Services Department, Water Quality for the most current contractor listings and contractual arrangements.

BMP SELECTION AND IMPLEMENTATION

Table 1
BMP SELECTION AND SEQUENCING GUIDE

Step No.	Description	What to Do	BMP Options (see Table 2 for BMP activities)
1.	Design Stage and Before Construction	Contact the Field Environmental Representative early, at the beginning of a project, and provide him/her with the project information on the current environmental project information form. This information will allow the Environmental Department to identify environmental concerns such as, but not limited to, permitting requirements, potentially required structural BMPs, and the identification of endangered species and/or impaired water bodies that must be avoided or mitigated. As another example, before construction, it may be necessary to evaluate, mark, and protect important trees and associated rooting zones, unique areas (e.g., wetlands), and other areas to be preserved.	Local SUSMP, CalGreen Code, or General Construction Storm Water Permit requirements 4-01, other user-defined BMPs
2.	Site Access Areas (construction entrances, roadways, equipment parking areas)	Stabilize site entrances and access roads if applicable prior to earthwork.	1-07, other user-defined BMPs
3.	Storm Drain/Drainage Inlet Protection	Install inlet protection at down-gradient inlets that project runoff/tracking might impact.	1-06, other user-defined BMPs
4.	Perimeter Sediment Control	Install perimeter sediment controls (silt fence, fiber rolls, etc.) as applicable prior to soil disturbing activities. Install additional runoff control measures during construction as needed.	1-02, 1-03, 1-04, 1-05, other user-defined BMPs
5.	Material and Waste Storage Areas	Prepare staging areas and material storage and disposal areas, as applicable, to reduce run-on and runoff. Install perimeter control, obtain clean-up materials, plastic covers for stockpiles, etc. prior to storing materials on site.	2-01 through 2-08, 1-08, other user-defined BMPs
6	Drainage Control and Run-on Diversion	Install run-on controls to direct run-on around or through the site to minimize erosion in addition to sediment control measures.	4-01 through 4-13, other user-defined BMPs
7.	Earthwork (trenching, excavation, grading, surface roughening, grubbing)	Begin excavation, trenching, or grading after installing applicable sediment and runoff control measures. Install additional control measures as work progresses as needed.	1-01 through 1-08, other user-defined BMPs
8.	Surface Stabilization (temporary and permanent seeding, mulching)	Apply temporary or permanent soil stabilization measures as applicable on all disturbed areas where work is delayed or completed.	4-01 through 4-08, other user-defined BMPs

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Table 1 (continued)
BMP SELECTION AND SEQUENCING GUIDE

Step No.	Description	What to Do	BMP Options (see Table 2 for BMP activities)
9.	Construction and Paving (install utilities, buildings, paving)	Implement applicable control practices as work takes place.	3-01 through 3-9, other user-defined BMPs
10.	Final Stabilization and Landscaping	Stabilize open areas as applicable. Remove temporary control measures and install final stabilization controls appropriately (topsoil, trees and shrubs, permanent seeding, mulching, sod, riprap)	3-07, 4-03, 4-04, other user-defined BMPs

BMP DETAILS

The previous section provides details for the selection and implementation of BMPs for the most common utility construction activities. Once the BMP objectives are defined, it is necessary to identify the category or categories of BMPs that are best suited to meet each objective.

A category is a grouping of BMPs related in how they prevent pollution. The four categories are:

- **Section 1 – Sediment Controls**
- **Section 2 – Waste Management and Material Controls**
- **Section 3 – Non-Storm Water Discharge Controls**
- **Section 4 – Erosion Control and Soil Stabilization**

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Section 1 – Sediment Controls

Why Are Sediment Controls Needed?

Sediment controls are needed to provide a secondary or back-up mechanism to erosion control techniques to prevent sediment discharges from a site. Erosion controls are designed to prevent erosion (the detachment of soil particles from the surface by rain, flowing water or wind), whereas sediment controls are designed to trap soil particles once dislodged by rain, flowing water, or wind. Sediment particles (soil/dust) from construction, operations, and maintenance (construction like) activities can be transported to a different location by wind or water flow. Once these particles have become detached, they can be transported by wind or runoff to water bodies where they can cause damage to aquatic life by burying the animals or plants or reducing oxygen and/or sunlight that is necessary for their survival. Soil particles can also carry other damaging pollutants with them. Displaced sediment from these activities is therefore considered a pollutant by water quality regulatory agencies.

What are Sediment Controls?

Sediment controls include any method that aids in trapping soil particles after they have been detached and moved by wind or water. Sediment controls are usually passive systems that rely on filtering or settling the particles out of the water or wind that is transporting them. The sediment that has accumulated by the BMPs can be redistributed as excess soil on the construction site. Sediment controls are most effective in retaining sediment on site when used in combination with erosion control BMPs. Sediment Controls presented in this Manual include the following:

- BMP 1-01 Scheduling
- BMP 1-02 Silt Fence
- BMP 1-03 Fiber Rolls
- BMP 1-04 Gravel Bag Berm
- BMP 1-05 Sand Bag Barrier
- BMP 1-06 Storm Drain/Drainage Inlet Protection
- BMP 1-07 Tracking Controls
- BMP 1-08 Stockpile Management
- BMP 1-09 Sediment Basin
- BMP 1-10 Sediment Trap
- BMP 1-11 Check Dams
- BMP 1-12 Active Treatment Systems (ATS)

What

Scheduling consists of the planning of soil disturbance activities to avoid periods of rain whenever practical.

When

Scheduling of soil disturbance activities must be considered year-round.

Where

All construction and "construction like" operations and maintenance sites where soil disturbance activities take place.

How

Use the following measures as applicable:

- Consider scheduling major soil disturbing activities or activities near environmentally sensitive areas (e.g., adjacent to water bodies) during prolonged periods when no rain is forecast.
- Monitor the weather forecast for seasonable and unseasonable rain events. Obtain weather information from the National Weather Service at
  - www.srh.noaa.gov/
- Print and maintain copies of forecasts to document decisions related to inspections and BMP implementation for projects subject to the CGP.
- Appropriate sediment controls are required year round. Always be prepared to deploy additional erosion and sediment control and soil stabilization BMPs as needed. Off site sediment discharges can occur because of unseasonable rain, vehicle tracking, unanticipated wind, and non-storm water discharges.
- Sequence work to minimize soil-disturbing activities during forecasted rain events.
- Limit disturbed soil area to the amount of acreage that can be protected prior to a forecasted rain event.
- Stabilize disturbed soil areas as soon as practical, and always prior to a forecasted rain event (See Section 4, Soil Erosion BMPs for soil stabilization methods).
- Protect environmentally sensitive areas, such as drainage channels, streams, and natural watercourses.
- When rain is forecast, adjust the construction schedule to implement soil stabilization and sediment controls on all disturbed areas prior to the onset of rain.

Maintenance and Inspection

- Review applicable scheduling and sequencing of construction activities throughout the project or activity to minimize the total area of exposed soil and the exposed soil exposure time.
- Inspect erosion and sediment controls prior to and after each storm event, and routinely throughout the construction and/or clean-up activity. If inspections warrant construction BMP changes, amend the schedule accordingly.

What

Silt fences are temporary linear sediment barriers made of permeable fabric that lets water through but prevents the majority of sediment from passing through. Silt fences also act by intercepting and slowing the flow of sediment-laden runoff and allowing sediment to settle from the runoff before water leaves the construction site.

When

- Silt fences are designed to intercept sheet flows to moderately concentrated flows.
- Generally, silt fences shall be used in conjunction with soil stabilization source controls up slope (see Section 4) to provide effective control, particularly for steep slopes, and slopes adjacent to water bodies or Environmentally Sensitive Areas (ESAs).
- Consider BMP 1-03 "Fiber Rolls" for minor slopes or perimeter sediment control on flat or slightly sloped areas.

Where

Silt fences are placed:

- Below the toe of exposed and erodible slopes.
- Down-slope of exposed soil areas.
- Around temporary stockpiles.
- Along streams and channels.
- Along the perimeter of a project.
- Consider BMP 1-03 "Fiber Rolls" for small stockpiles and perimeters of areas with shallow slopes.

How

- Construct silt fences with a setback of at least 3 feet from the toe of a slope in areas suitable for temporary ponding or deposition of sediment. Where a 3-foot setback is not practical, construct as far from the toe of the slope as practical.
- Construct the length of each reach (length of fence) so that the change in base elevation along the reach does not exceed one-third of the barrier height; each reach should not exceed 500 feet. The last 6 feet of the reach should be turned up slope.
- The maximum length of slope draining to the silt fence should be 200 feet or less.
- Excavate a trench approximately 6 inches wide and 6 inches deep to place the bottom of the silt fence into, ensuring that is not wider or deeper than necessary.
- Key-in, or bury the bottom of silt fence fabric in the trench and tamp into place. If it is not feasible to trench along the slope contour, use sand bags or backfilling to key in the bottom of the fabric.
- Install fence posts at least 12 inches below grade on the down slope side of trench.

- **Silt fences should not be used to divert water. Silt fences should not be considered for installation below slopes steeper than 1:1 (vertical: horizontal) or that contain a high number of rocks or loose dirt clods unless the rocks are removed and erosion and soil stabilization controls (Section 4) are used up slope.**

Maintenance and Inspection

- Repair or replace split, torn, slumping, undercut or weathered fabric. Note that fabric may need to be replaced when installation is required for more than 5 to 8 months due to limited durability.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection (cont.)

- Inspect silt fences prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Remove accumulated sediment when it reaches one third of the barrier height. Removed sediment shall be incorporated in the project at appropriate locations or disposed of in accordance with federal, state and local requirements.
- Silt fences that are damaged and become unsuitable for the intended purpose shall be removed and disposed of and replaced with new silt fence barriers or other applicable control.
- Remove silt fence when no longer needed and after up-gradient areas are permanently stabilized. Fill and compact post-holes and the anchor trench, remove sediment accumulation, and work the surface of the fence alignment to blend with adjacent ground.

Pictures

Silt fence installed with at least a 3 foot setback from the toe of an erodible slope. Note that use is combined with fiber rolls and serves as perimeter control.

Corresponding CASQA Fact Sheet

Fact Sheet SE-1

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

A fiber roll (straw waddle) consists of straw, flax or other similar materials that are rolled and bound into a roll. The fiber roll lets water through but prevents the majority of sediment from passing through. Fiber rolls also act by intercepting and slowing the flow of sediment-laden runoff and allowing sediment to settle from the runoff before water leaves the construction site. In sensitive vegetation areas, only certified weed-free rice straw is to be used.

When

Fiber rolls are used for sheet flow or where flows are slightly to moderately concentrated.

Where

Fiber rolls are generally placed on the face of slopes at regular slope intervals to intercept runoff, reduce flow velocity, release the runoff as sheet flow and provide sediment removal.

- May be used along the top, face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- Fiber rolls are appropriate for perimeter site control or along streams, channels, storm drain inlets, or around stockpiles to intercept sediment-laden storm water and non-storm water runoff.

How

Installation

- Locate fiber rolls on level contours spaced in accordance with the CGP requirements for LUP Type 2 & 3 and Risk Level 2 & 3 sites as follows:

Slope Grade	Spacing (sheet flow length not to exceed)
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

- In non-paved areas, stake fiber rolls into a trench that is the width of the roll and one-third the depth of the roll (2- to 4-inch deep trench).
- Drive stakes into fiber rolls at a minimum of 4-foot intervals.
- If more than one fiber roll is placed in a row, fiber rolls should be overlapped and not abutted together.

Removal

- When used in a permanent application, fiber rolls can be left in place.
    - Permanent fiber rolls are typically encased with a biodegradable material.
    - Note that removal can result in greater soil disturbance.
- When used for a temporary application as storm drain inlet protection or stockpile control for example, the fiber rolls should be removed at the completion of the construction cleanup activity in that area.
    - Temporary fiber rolls are typically encased with plastic netting that does not biodegrade.
    - Remove fiber rolls only when up gradient areas are stabilized and/or pollutant sources are no longer a hazard.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Remove fiber rolls before vegetation becomes too mature to avoid unnecessary soil and vegetation disturbance.
  - If fiber rolls are removed, collect and dispose of fiber roll and sediment accumulation as appropriate in accordance with federal, state and local requirements. Trapped sediment may be incorporated into the construction site. Fill and compact holes, trenches, depressions, or any other ground disturbance to blend with adjacent ground.
- Note that the cost of disposal of wet fiber rolls may be more expensive than dry fiber rolls.

Maintenance and Inspection

- Repair or replace spilt, torn, unraveling, or slumping fiber rolls.
- Inspect fiber rolls if rain is forecasted and perform maintenance as needed.
- Inspect fiber rolls prior to and after each rain event, and daily during extended rain events throughout the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Do not use fiber rolls containing polyacrylamindade or other flocculants. Use is considered "active treatment" and is subject to ATS requirements of the CGP (see BMP Detail 1-12).

What

A gravel bag berm consists of at least a single row of gravel bags that are installed end-to-end to form a barrier across a slope to intercept runoff.

When

Use gravel bag berms:

- When needed to reduce storm water flow velocity, release the runoff as sheet flow, and provide some sediment removal.
- Gravel bag berms can also be used when flows are moderately concentrated and when it is desirable to filter sediment in runoff. Gravel bag berms are generally more permeable than sand bags.

Where

- Ditches, swales, and storm drain inlets
- Gravel bag berms are also appropriate for perimeter site control or along streams, channels, storm drain inlets, or around stockpiles to intercept sediment laden storm water and non-storm water runoff.
- Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- Gravel bags may be implemented with other BMPs to maximize sediment containment.
- Sand bag barriers should be used in cases where it is desirable to block and pond flows (BMP 1-05 "Sand Bag Barrier").

How

- When used as a linear control for sediment removal:
  - Install along a level contour.
  - Turn ends of gravel bag row up slope to prevent flow around the ends.
  - Generally, gravel bag barriers are used in conjunction with temporary soil stabilization controls up slope to provide effective control.
- When used for concentrated flows:
  - Stack gravel bags to required height. When the height requires 3 rows or more, use a pyramid approach.
  - Upper rows of gravel bags shall overlap joints in lower rows.
- Construct gravel bag barriers with a setback of at least 3 feet from the toe of a slope. Where a 3-foot setback is not practical, construct as far from the toe of the slope as practical.

Maintenance and Inspection

- Perform routine inspections of gravel bag berms prior to and after each storm event, and daily during extended rain events throughout the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Reshape or replace gravel bags as needed.
- Repair washouts or other damage as needed. Note that bags may need to be replaced when installation is required for more than 6 months due to limited durability.
- Inspect gravel bag berms for sediment accumulations and remove sediment when accumulation reaches one-third of the berm height. Removed sediment shall be incorporated in the project at appropriate locations or disposed of in accordance with federal, state and local requirements.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection (cont.)

- Remove gravel bag berms when no longer needed and when feasible, recycle gravel fill. Remove sediment accumulation, and clean, re-shape, and stabilize the area. Removed sediment shall be incorporated in the project at appropriate locations or disposed of in accordance with federal, state and local requirements.

Pictures

Gravel bags and fiber rolls used as perimeter sediment controls.

Gravel bags used as perimeter control.

What

A sand bag barrier is a temporary linear sediment barrier consisting of at least one row high of sand bags placed end-to-end, designed to intercept and slow sediment-laden storm water and non-storm water runoff. Sand bag barriers allow sediment to settle from runoff before water leaves the construction site. Sand bag barriers tend to block and pond storm water flows.

When

- During construction or operation and maintenance activities in streambeds when the contributing drainage area is small.
- To capture and detain non-storm water flows.
- When site conditions or activity sequencing require adjustments or relocation of the barrier to meet changing field conditions and needs during construction.
- To temporarily close or continue broken, damaged or incomplete curbs.

Where

Sand bag barriers are used:

- To divert or direct flow away from disturbed slopes or create a temporary sediment basin.
- Where flows are moderately concentrated, such as ditches, swales, and storm drain inlets to divert and/or detain flows.
- Along the perimeter of a site, vehicle and equipment fueling and maintenance areas, chemical storage areas, or stockpiles.
- Below the toe or down slope of exposed and erodible slopes.
- Parallel to streams, channels, and roadways.
- Across channels to serve as a barrier for utility trenches or provide a temporary channel crossing for construction equipment, or to reduce stream impacts.
- Caution – do not use sand bag barriers in traffic areas or other areas where potential flooding is possible. Consider use of BMP 1-03 "Fiber Rolls" or BMP 1-04" Gravel Bag Berms."

How

- When used as a linear control for sediment removal:
  - Install along a level contour.
  - Turn ends of sand bag row up slope to prevent flow around the ends.
  - Generally, sand bag barriers shall be used in conjunction with temporary soil stabilization controls up slope to provide effective control.
- When used for concentrated flows:
  - Stack sand bags to required height. When the required height is three rows or more, use a pyramid approach. Upper rows of sand bags shall overlap joints in lower rows.
  - Construct sand bag barriers with a setback of at least 3 feet from the toe of a slope. Where a 3-foot setback is not practical, construct as far from the toe of the slope as practical.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection

- Perform routine inspections of sand bag barriers prior to and after each storm event, and daily during extended rain events throughout the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP. Repair washouts or other damages as needed.
- Note that bags may need to be replaced when installation is required for more than 6 months due to limited durability.
- Inspect sand bag barriers for sediment accumulations and remove sediments when accumulation reaches one-third the barrier height.
- Remove sand bags when no longer needed and when feasible, recycle fill. Remove sediment accumulation, and clean, re-grade, and stabilize the area. Incorporate removed sediment at appropriate project locations or disposed of in accordance with federal, state and local requirements.

Pictures

Fact Sheet SE-8

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

A BMP or a combination of BMPs used at storm drains or other drainage inlets to protect against the discharge of sediment-laden storm water and non-storm water runoff from construction or operational and maintenance activities. The BMP slows or ponds the storm water flow, giving the sediment time to settle out before discharge to the storm drain.

When

This BMP is required on all construction projects and operation and maintenance sites when sediment laden surface runoff may enter a storm drain inlet and/or drainage to watercourses. Do not construct when runoff will result in ponding into road traffic or onto erodible surfaces or slopes, or overflow onto the sidewalk.

Where

At downstream storm drain and/or drainage inlets that have the potential to be impacted by construction or "construction like" operation and maintenance activity, site storm water run-off, or non-storm water discharges.

How

- Identify all downstream storm drain inlets or drainages that have the potential to receive runoff or non-storm water discharges from construction activities.
- Where a storm drain or drainage inlet is on or at the bottom of a slope, a series of small check dams (i.e., gravel bag berms) constructed at intervals along the slope may be required to slow the runoff. See BMP 1-11.
- Select appropriate protection and construct inlet protection based on the configuration of inlets at the site.
- Some municipalities require removal of BMPs from storm drains within 72 hours of a rain event (e.g., City of San Diego requires removal of inlet protection in the case that 0.25 inch or greater of rain is predicted). Consult with your project Field Environmental Representative for local requirements.
- Remove inlet protection devices at the end of the construction period, or when the inlet can no longer be impacted by the project or activity.

Maintenance and Inspection

- Perform routine inspections of BMPs prior to and after storm event, and daily during extended rain events throughout the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- During inspections:
  - Inspect bags, silt fence, or filter fabric for holes, gashes, and snags.
  - Check gravel bags for proper arrangement and displacement.
  - Remove the sediment behind the barrier when it reaches one-third of the barrier height. Removed sediment should be incorporated in the project or disposed of in accordance with federal, state and local requirements.

What

Tracking controls consist of constructed/manufactured steel plates (rumble plates) or gravel. Tracking controls reduce offsite tracking of sediment and other pollutants by providing a stabilized entrance at defined soil disturbance activity site entrances and exits with materials that aid in removing sediment from vehicles, especially their tires or tracks. Controls can also consist of providing methods to clean-up sediment or other materials to prevent them from entering a storm drain, such as sweeping or vacuuming. Tracking controls can also include implementing tire washing.

When

- Stabilized entrances/exits should be implemented on each soil disturbance site having a defined entrance/exit consisting of soil which terminates into a paved roadway or substantial paved surface. Stabilized entrances/exits are in addition to other applicable BMPs.
- Daily sweeping or vacuuming should be implemented when sediment is tracked from the site onto public or private paved roads, typically at points of site exit.
- Install and implement tire washing when the above methods are not adequately controlling track-out.

Where

Use stabilized entrances and/or sweeping (and tire washing, if needed) at construction and "construction like" operations and maintenance activity sites:

- where dirt or mud is tracked onto public roads;
- adjacent to water bodies;
- where poor soils are encountered, such as soils containing clay; and
- where dust is a problem during dry weather conditions.

How

<u>Stabilized Entrances</u>

- Limit the points of entrance/exit to the construction or operations and maintenance site by designating combination or single purpose entrances and exits. Require all employees, subcontractors and others to use them. Limit speed of vehicles to control dust.
- Where feasible, grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment-trapping device before discharge (see BMP 1-10).
- Design stabilized entrance/exit to support heaviest vehicles and equipment.
- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions.
- Use of constructed or constructed/manufactured steel plates with ribs for entrance/exit access is allowed.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 inches deep, or place aggregate to a depth recommended by a geotechnical engineer. A crushed aggregate greater than 3 inches but smaller than 6 inches shall be used.

<u>Street Sweeping and Vacuuming</u>

- Inspect potential sediment tracking locations routinely.
- Visible sediment tracking should be swept or vacuumed as needed. Manual sweeping is appropriate for small jobs.

How

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

(cont.)

- For larger projects, it is preferred to use mechanical sweeping methods that collect removed sediment and material.
- If not mixed with debris or trash, incorporate the removed sediment back into the project or dispose of in accordance with federal, state and local requirements.

Tire Washing

- Design wash rack to support the heaviest traffic loads.
- Provide a turnout or doublewide exit to avoid traffic from entering through the tire washing area.
- Design a drainage ditch to route all rinse or wash waters from the tire washing area to a sediment trapping device (see BMP 1-10) to prevent any wash runoff from leaving the site.
- Hoses should be equipped with automatic shutoff nozzles.

Maintenance and Inspection

Stabilized Entrances

- Inspect routinely for damage and assess effectiveness. Remove sediment and repair if the stabilized entrance/exit is clogged with sediment.
- Perform routine inspections of BMPs, prior to and after storm events, and daily during extended rain events throughout the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the CGP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Where tracking has occurred on roadways, sweeping should be conducted the same day. Water should not be used to wash sediment off the streets, unless necessary. If water is used, it must be captured, preventing sediment-laden water from running off the street or site.
- Keep all temporary roadway ditches clear.

Street Sweeping and Vacuuming

- Inspect silt fences prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect all site paved access roads daily and remove any sediment or other materials on the roads by vacuuming or sweeping daily, as needed, and prior to any rain event in accordance with the CGP Risk Levels 2 & 3 requirements.
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- After sweeping is finished, properly dispose of sweeper wastes.

Tire Washing

- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect rack and/or sediment trap system routinely for damage and assess effectiveness. Remove accumulated sediment to maintain system

What

Stockpile management consists of placing temporary BMPs, such as secured covers, over the piles, and/or placing berms, silt fences, fiber rolls, sand/gravel bags or straw bale barriers around the perimeter of stockpiles. Soil stabilizers/binders may also be used to augment stockpile management (BMP 4-05).

When

Use this BMP when construction projects or operation and maintenance activities require stockpiled soil, waste materials, and/or paving materials. Protection of stockpiles must be implemented whenever there is a potential for transport of materials by a water source or by wind.

- Construction and waste material stockpiles require protection from rain and wind at all times unless actively being used (protect during non-activity). Projects with SWPPPs require protection at the end of each day.

Where

Stockpiles at construction and "construction like" operation and maintenance activity sites, protecting against both run-on and run-off.

How

One or more of the following options may be used to manage stockpiles and prevent stockpile erosion and sediment discharges for storm water and non-storm water runoff/run-on.

  - Stockpile may be returned to the excavation if precipitation is forecast.
  - Sufficient BMP materials for temporary stockpile protection should be available onsite. Select cover materials or methods based on anticipated duration.
  - Protect stockpiles from storm water run-on and sediment runoff from the stockpiles using a temporary perimeter sediment barrier such as berms, silt fences, fiber rolls, sand/gravel bags, or straw bale barriers, as appropriate.
  - Cover stockpiles to prevent erosion. Note that the CGP requires that inactive stockpiles be covered. Where feasible, cover/protect stockpiles using a soil binder, according to BMP 4-05. Alternately, secure stockpiles with covers such as Visqueen weighted down with gravel bags, or sand bags. Plastic should be properly re-used or disposed of properly. Note the CGP discourages the use of plastic materials for cover when more sustainable alternatives can be used.
  - Stockpiles may be hauled off or temporarily stored in a protected location off site.
- Keep stockpiles organized and surrounding areas clean.
- Protect storm drain inlets, watercourses, and water bodies from stockpiles, as appropriate.
- Implement dust control practices as appropriate on all stockpiled material.

- **Stockpiles should be covered, stabilized, or protected prior to the onset of precipitation.**

Maintenance and Inspection

- Repair and/or replace covers, and perimeter containment structures as needed.
- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.

What

Sediment basins are temporary basins formed by excavation or by constructing an embankment to temporarily detain sediment-laden runoff, allowing sediment to settle out before water leaves the site. The CGP specifies that sediment basins be designed per the CASQA fact sheet SE-2, therefore, this BMP provides general guidance and the CASQA handbook reference.

When

Sediment basins are appropriate:

- If sediment-laden water may enter a drainage system or watercourse.
- If areas are disturbed during the rainy season, in association with dikes, temporary channels, and pipes to convey runoff from disturbed areas.
- To construct before land disturbance, when feasible.
- In conjunction with erosion controls.

Where

Sediment basins are suitable on larger projects with sufficient space for the basin, and should be considered:

- Where maintenance is possible year-round.
- Within property limits, and where failure will not result in loss of life, building damage, or interruption of public roads or utilities.
- At the outlet of disturbed areas draining generally between 5 and 75 acres, evaluated on a site-specific basis.
- Where post-construction detention basins are required.

How

Design the sedimentation basin in accordance with CASQA fact sheet SE-2.

- In general, the basin depth must be no less than 3 feet, not including freeboard, which includes a sediment storage zone and a settling zone of at least 1 and 2 feet deep, respectively.
- Include features to accommodate overflow or bypass flows that exceed the design storm event.
- Utilize rock, vegetation, or other erosion control measures to protect the basin inlet, outlet, and slopes against erosion.
- Continuous fencing should be provided around the sedimentation basin to prevent unauthorized entry.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection

- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect basin banks for seepage and structural soundness.
- Check inlet and outlet structures, spillway, and fencing for damage or obstructions. Repair damage and remove obstructions as needed.
- Remove accumulated sediment when it reaches 1/2 of the basin height or in accordance with the SWPPP requirements. Removed sediment shall be incorporated into the project appropriately or disposed of in accordance with federal, state and local requirements.
- Remove accumulation of any vegetation during every inspection.
- Remove standing water from the basin within 72 hours after accumulation to prevent the production of mosquitoes.
- Completely remove basin when no longer needed. Remove sediment accumulation. Fill and compact excavation, any fencing post-holes and anchor trench, and blend the surface with the adjacent ground.

What

Sediment traps are small, temporary containment areas where sediment-laden runoff is detained, allowing sediment to settle from the runoff before water leaves the site. Sediment traps are formed by excavating or constructing an earthen embankment across a waterway or low drainage area, and usually have a gravel outlet. Sediment traps only remove large and medium-sized soil particles and require upstream erosion control.

When

Sediment traps are appropriate:

- If the drainage area is less than 5 acres.
- If sediment-laden water may enter a drainage system or watercourse.
- Construction or operation and maintenance activity occurs in small drainage areas with no unusual drainage features, and short-duration construction activities.
- To construct before land disturbance, when feasible.
- In conjunction with upstream erosion controls.

Where

Sediment traps are suitable on sites with sufficient space to allow for infiltration and sediment settling, and should be considered:

- Outside the area being graded, but as near as practical to sediment producing areas, with access for maintenance.
- At the perimeter of a site, at one or more locations where sediment-laden runoff is discharged offsite, to a storm drain or watercourse.
- Around or upslope from storm drain inlet protection measures.
- Within property limits and where failure will not result in loss of life, building damage, or interruption of public roads or utilities.

- **Should not be located in streams unless properly permitted with regulatory agencies. Consult with the Field Environmental Representative.**

How

- Design the sediment trap per referenced engineering standards or local grading ordinance.
- Trap side slopes should be 1:3 (vertical: horizontal) or flatter.
- Trap should be sized to accommodate a settling zone and sediment storage zone with recommended minimum volumes of 67 yd^3/acre and 33 yd^3/acre of contributing drainage area, respectively, based on 0.5 inch of runoff volume over 24 hours. Larger or multiple traps may be required to accommodate specific rainfall, soil, or site conditions.
- Traps with an impounding levee greater than 4.5 feet tall, measured from the lowest point of the impounding to the highest point of the levee, and traps capable of impounding more than 35,000 ft^3, should be designed by a California Registered Civil Engineer.
- The outlet pipe or open spillway must be designed to convey anticipated peak flows.
- When an earth or stone outlet is used, the outlet crest elevation should be at least 1 foot below the top of embankment.
- When a crushed stone outlet is used, the crushed stone or gravel should meet AASHTO M43, size No. 2 or 24, or its equivalent.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Clear any vegetation under the embankment and pool area.
- The compacted embankment fill material must be free of roots, vegetation, oversize, or other objectionable material.
- When a riser is used, all pipe joints must be watertight, and at least the top 2/3 of the riser should be perforated with 0.5-inch diameter holes spaced 8 inches vertically and 10 to 12 inches horizontally.
- Utilize rock, vegetation, or other erosion control measures to protect the trap outlets against erosion.
- Fencing should be provided around the trap to prevent unauthorized entry.

Maintenance and Inspection

- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect trap banks for seepage and structural soundness.
- Inspect outlet structures, spillway, and fencing for any erosion, damage, or obstructions. Repair damage and remove obstructions as needed.
- Remove accumulated sediment when it reaches one third of the trap capacity. Removed sediment shall be incorporated in the project appropriately or disposed of in accordance with federal, state and local requirements.
- Remove accumulation of any vegetation during every inspection.
- Water suitable for mosquito production may stand in the sediment trap, particularly if subjected to daily non-storm water flows. Remove standing water from the trap 72 hours after accumulation.
- Remove trap when no longer needed. Remove sediment accumulation, fill and compact excavation, any fencing post-holes, and blend the surface with adjacent ground.
- BMPs that require dewatering shall be continuously attended during dewatering. Dewatering BMPs shall be implemented at all times during such activities.

What

Check dams are small barriers constructed of rock, logs, gravel bags, sandbags, fiber rolls, or other suitable materials, placed across a swale or drainage ditch. Check dams create small pools and reduce the effective slope of the channel, reducing scour and erosion by reducing flow velocity and increasing residence time within the channel. Check dams promote sediment trapping.

When

Check dams are appropriate:

- If sedimentation should be promoted behind the dam.
- If erosion protection is desired in small intermittent channels and temporary swales.
- During the establishment of grass linings in drainage ditches or channels.
- If grade control is desired or required.

Where

Check dams should be considered:

- In small open channels that drain 10 acres or less.
- In channels to reduce slope and storm water runoff velocities.
- In temporary ditches where the short length of service does not warrant establishment of erosion-resistant lining.

Check dams should not be used:

- **In streams or in channels with flow between storm events.**
- In channels that are already grass-lined, unless erosion potential or sediment-laden flow is expected. Installation of check dams may damage vegetation.

How

- Do not construct check dams with straw bales or silt fence, since concentrated flows quickly wash out these materials.
- Check dams reduce the capacity of the ditch or swale. Alternative BMPs or an increased swale or ditch size may be necessary or the size of the ditch or swale may need to be increased to prevent overtopping.
- Maximum slope and velocity reduction is achieved when the toe of the upstream dam is at the same elevation as the top of the downstream dam. The center section of the dam should be lower than the edge sections (at least 6 inches), acting as a spillway, so that the check dam will direct flows to the center of the ditch or swale.
- The check dam should be installed along a level contour and should completely span the ditch or swale to prevent washout.
- Install the first check dam approximately 16 feet from the outfall device and at regular intervals based on slope gradient and type.
- Check dams should be placed at a distance and height to allow small pools to form between each check dam.
- For multiple check dam installation, backwater from a downstream check dam should reach the toe of the upstream check dam.
- High flows (typically a 2-year storm or larger) should safely flow over the check dam without an increase in upstream flooding or damage to the check dam.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Rock check dams are usually constructed of 8 to 12 inch rock placed individually by hand or mechanically, but never dumped. The rock used should be large enough to stay in place given the expected channel flow. Abutments should be extended 18 inches into the channel bank. Rock can be graded such that smaller diameter rock (2 to 4 inches) is located on the upstream side of larger rock, increasing residence time.
- Log check dams are usually constructed of 4 to 6 inch diameter logs installed vertically, and embedded at least 18 inches into the soil, and can be bolted or wired.
- See BMP 1-03 for installation of fiber roll check dams. Fiber rolls should be trenched in, backfilled, and firmly staked.
- Gravel bag and sand bag check dams are constructed by stacking bags across the ditch or swale. Gravel bags and sand bags used to construct check dams should conform to the requirements of BMP 1-04 and 1-05, respectively. Tightly abut bags and stack in a pyramid fashion no higher than 3 feet. Upper rows shall overlap joints in lower rows.
- Manufactured products used to construct check dams should be installed in accordance with the manufacturer's instructions, and typically requires trenching or anchoring.
- If grass is planted to stabilize the ditch or swale, the check dam should be removed when the grass has matured, unless the slope of the swale is greater than 4 percent.

Maintenance and Inspection

- Check dams require extensive maintenance following high-velocity flows.
- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Replace missing, damaged, or degraded rock, bags, rolls, etc.
- If the check dam is used as a grade control structure, sediment removal is not required as long as the system continues to control the grade.
- Sediment can be re-suspended during subsequent storms or removal of the check dam. Remove accumulated sediment when it reaches 1/3 of the barrier height, and prior to permanent seeding or soil stabilization. Removed sediment shall be incorporated in the project at appropriate locations or disposed of in accordance with federal, state and local requirements.
- Water suitable for mosquito production may stand behind check dams, particularly if subjected to daily non-storm water flows. Remove standing water from the dam 72 hours after accumulation.
- Remove check dam and accumulated sediment when no longer needed.

What

Active Treatment Systems (ATS) reduce turbidity of runoff by introducing chemicals to storm water through direct dosing or an electrical current to enhance flocculation, coagulation, and sediment settling. Coagulants and flocculants include inorganic salts and polymers which enhance sediment settling and removal and reduce turbidity. The CGP has specific requirements for ATS. Only general guidance for ATS is provided in this BMP; additional details are provided in the CASQA Handbook.

Limitations:

- **Specific permit requirements or mitigation measures such as RWQCB 401 Certification, U.S. Army Corps of Engineers 404 permit, and approval by the California Department of Fish and Game supersede the guidance in this BMP.**
- If numerical water quality standards are mentioned in any permits, testing and sampling may be required. Streams listed as 303(d) impaired for sediment, silt, or turbidity, are required to conduct sampling to verify that there is no net increase in sediment load due to construction activities.

When

ATS should be used when a rigorous combination of drainage control, erosion control, and sediment control BMPs are not effective or are not anticipated to be effective based on site soil types (e.g., fine grained or highly erosive soils), proximity to sediment-sensitive receiving waters, and/or other site constraints. Phasing and limiting active areas of disturbance should be considered prior to use of an ATS.

Where

ATS should be considered where turbid discharges to sediment and turbidity sensitive waters cannot be avoided using traditional BMPs.

How

- **ATS should be implemented in accordance with the guidance provided in the CASQA Handbook.**
- **Dischargers choosing to utilize chemical treatment in ATS must also follow all guidelines of the CGP Attachment F – Active Treatment System Requirements.**

Maintenance and Inspection

- ATS must be operated and maintained by experienced personnel meeting CGP training requirements at all times during treatment operations. Visual monitoring for proper performance shall be performed daily and recorded in a data log. The project data log shall include the name, phone number, and training documentation of the person responsible for operating and monitoring ATS.
- Requirements for ATS shall include but are not limited to operational and compliance monitoring, toxicity monitoring for batch and flow-through treatments, numeric effluent limit compliance, operator training, implementation of standard BMPs, and proper sediment removal and disposal.

Section 2 – Waste Management and Material Controls

Why Are Waste Management and Material Controls Required?

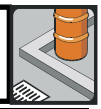
Federal, state and local laws, regulations, ordinances and permits prohibit the discharge of contaminated storm water to storm drains, drainages, and surface waters. Pollutants such as litter, paint, solvents, fuel, lubricants and demolition wastes, can be transported by runoff from a construction site. These BMPs address pollutants associated with material use and waste management to ensure that all pollutants are properly managed and are not discharged to storm drains, drainages, and surface waters.

What are Waste Management and Material Controls?

Waste Management and Materials Controls are source control BMPs that reduce or prevent contact between wastes and/or materials and storm water. Waste Management and Materials Controls presented in this Manual include the following:

- BMP 2-01 Material Delivery and Storage
- BMP 2-02 Material Use
- BMP 2-03 Spill Control
- BMP 2-04 Solid Waste Management
- BMP 2-05 Hazardous Materials/Waste Management
- BMP 2-06 Contaminated Soil Management
- BMP 2-07 Sanitary/Septic Waste Management
- BMP 2-08 Liquid Waste/Drilling Fluid Management

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Material Delivery and Storage Controls are procedural BMPs controlling the delivery and storage of construction materials, supplies and wastes so that storm water run-on and run-off and non-storm water discharges do not contact the material or wastes.

When

This BMP is applicable when it is necessary to store materials at a construction or operations and maintenance site, and does not apply to materials and supplies stored on trucks that are driven on site and off site daily.

Where

All construction or operations and maintenance activity sites where construction material is delivered or stored and has the potential to be contacted by storm water.

How

Use the following BMP measures as appropriate:

- Only store the minimum amount of material that is needed for the job.
- Locate storage areas away from storm drain inlets, drainage systems, and watercourses to prevent storm water run-on from reaching the materials.
- If practical, store materials in enclosed storage containers such as cargo containers.
- Store materials on impervious surfaces or use plastic groundcovers and berms on bare soil to prevent spills or leakage from contaminating the ground.
- For known hazardous materials, keep materials covered using plastic or other waterproof materials.
- Store chemicals in water tight containers with appropriate secondary containment systems or in a storage shed to prevent contaminated run-off/run-on from leaving storage areas.
- Keep an adequate supply of spill kit materials nearby.
- Ensure that qualified personnel are available when hazardous materials are delivered to ensure proper delivery and storage in a designated area.
- Material Safety Data Sheets (MSDS) should be made available on-site for all materials stored that have the potential to come in contact with storm water.
- When a storage area is no longer needed, return it to original condition.
- Bagged materials such as cold patch, concrete mix, and other materials with the potential to pollute runoff should be placed on pallets and covered during non-working days and prior to and during rain events.

Maintenance and Inspection

- Repair or replace covers, containment structures, or perimeter controls as needed to ensure proper function.
- Perform Routine BMP inspections of labels on containers and designated delivery and storage areas.
- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.

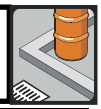
Pictures

Materials are covered and neatly stored within a curbed area.

Corresponding CASQA Fact Sheet

Fact Sheet WM-1

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Material Use is a procedural BMP that controls the amount or use of materials, chemicals and/or hazardous substances stored onsite and minimizes their potential for contact with storm water run-on or runoff or by non-storm water discharges.

When

Apply the Material Use BMP when the following materials are used or prepared on site:

- Pesticides (herbicides, insecticides, and biocides).
- Fertilizers and soil amendments.
- Detergents.
- Petroleum products such as fuel, oil, and grease.
- Asphalt and other concrete components.
- Hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds.
- Mastic, pipe wrap, primers, and paint.
- Concrete compounds.
- Welding material.
- Other materials that may be detrimental if released to the environment.

Where

All construction and operations and maintenance activity sites that utilize the above materials.

How

- Only use products or materials onsite that have been approved through the SDG&E Product Approval process.
- Reduce or eliminate use of hazardous materials on site when practical. Contact your Field Environmental Representative for additional information.
- Do not remove the original product label; it contains important safety and disposal information. Use the entire product before disposing of the container.
- Thoroughly dry empty latex paint cans, used brushes, paint rags, absorbent materials, and drop cloths. These dry wastes may be disposed of with other construction debris.
- When possible, mix paint indoors, otherwise use secondary containment structures. Do not clean paintbrushes or rinse paint containers into a street, gutter, storm drain, sanitary sewer or watercourse.
- Dispose of any paint thinners, residue, and sludge that cannot be recycled as hazardous waste (see BMP 2-05). For water-based paint, clean brushes to the extent practical, and rinse into a concrete washout pit or temporary sediment trap. Do not allow liquid to discharge to a storm water conveyance system. For oil-based paints, clean brushes to the extent practical and filter and reuse thinners and solvents.

- If possible, recycle residual paints, solvents, non-treated lumber, and other materials.
- **Do not over-apply fertilizers, pesticides, and soil amendments. Prepare only the amount needed. Strictly follow the recommended usage instructions.**

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- For termiticide applications (termite control pesticide) refer to CASQA Fact Sheet WM-2 "Material Use." Note that termiticide can only be applied when it is done in accordance with all applicable federal, state and local labeling requirements and in no case shall it be applied in a manner that would result in either a direct or indirect (e.g., drift) discharge to waters of the US or state.
- Keep an ample supply of spill cleanup material near use areas. Instruct employees in spill cleanup procedures.

Maintenance and Inspection

- Spot-check employees and contractors regularly throughout the job's duration to ensure appropriate practices are being employed.
- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable).

Pictures

What

Spill Control is a procedural BMP used to control, contain, and clean-up spills on site so that storm water run-on and runoff and non-storm water discharges do not become contaminated.

When

This BMP applies to all personnel present at construction and operations and maintenance activity sites at all times. Spill control procedures are implemented anytime chemicals (liquid or solid form) and/or hazardous materials and/or wastes are handled, used or stored. A single handling, use, or storage of a hazardous material or waste is sufficient to trigger this requirement. Such substances may include, but are not limited to fuels, lubricants, solvents, fertilizers, pesticides, herbicides, soil binders, coolants, paints, and sewage.

To the extent that work can be accomplished safely, spills of materials or chemicals shall be contained and cleaned up immediately.

Where

All construction and operations and maintenance activity sites where chemicals and/or hazardous materials and/or wastes are handled, used, or stored.

How

- Install and maintain spill control and cleanup kits in areas where any chemicals and/or hazardous materials and/or waste are handled, used and/or stored.
- Construction Supervisor, Crew Foreman, or Facility Supervisor and sufficient onsite personnel should be trained in spill control to address potential spills on the site.
- Only staff trained on spill response procedure should be used to control spill.
- If the spill is a threat to life or the environment, or other emergency situation where emergency medical support, fire department response, or outside assistance is needed, ***immediately*** call the **911** Operator and the local emergency response agency (usually the local fire department). Then, promptly call **Service Dispatch (Trouble) @ (619) 725-5100** and your supervisor.
- For all spills ***immediately*** notify the acivity and site supervisor ***and***/or the Field Environmental Representative and describe the spill and current situation. The Field Environmental Representative will make any required regulatory agency notifications per Environmental Standard (ES) G7841 and the Company's Release Reporting Scenario Guidance available on the Environmental Services Department website.
- If possible, and if you have proper training and personal protective equipment, stop the flow of the spill. If it can be done safely, contain the spill to a confined area. Containment may be able to be accomplished with:
    - Earthen berms
    - Sand bags
    - Absorbent booms
    - Absorbent socks

  Containment material on site as part of the Spill Kit should reflect site characteristics. For guidance, request assistance from the Field Environmental Representative.
- To the extent that it doesn't compromise cleanup activities, spills shall be covered and protected from storm water run-on/-off during rain events.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Immediately clean the impacted area, and properly dispose of any impacted materials.
  - Spills shall not be buried, except as necessary for immediate interim containment purposes. Spilled material and impacted burial material must be removed as soon as possible after proper control and containment and properly disposed of.
  - Use absorbent materials on spills to thoroughly clean up the material to the maximum extent possible. Spills shall not be diluted with water or other liquid for purposes of mitigating the spill (the solution to pollution is not dilution). When it is necessary to use water or other liquid for final cleaning and decontamination of a spill, the water or other liquid shall not be allowed to enter storm drain inlets, drainages, or watercourses, and shall be collected and disposed of properly. Coordinate disposal of these wastes with the Field Environmental Representative.

    Used clean up materials, contaminated materials, and recovered spill material shall be stored and disposed of in accordance with federal, state and local regulations and BMP 2-05 "Hazardous Materials/Waste Management."

Maintenance and Inspection

- Perform routine inspections to verify that spill control clean-up materials are located near material storage, unloading, and use areas prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable).

What

Solid Waste Management is a procedural BMP used to minimize site non-hazardous solid waste generation, and control the contact of site non-hazardous solid waste with storm water or non-storm water runoff.

Examples of potential solid wastes requiring management control BMPs include, but are not limited to:

- Concrete, cement, asphalt rubble, masonry brick/block.
- Vegetation debris, general trash, and materials used to transport and package construction materials.
- Steel and scrap metals, pipe, electrical cuttings and equipment parts.
- Hazardous Materials/Waste Management is covered in BMP 2-05.

When

During all phases of construction or operations and maintenance activities

Where

These BMPs should be used on all construction projects and operations and maintenance activities that generate solid waste.

How

- Practice good housekeeping and keep site clean.
- Use dry methods for site cleanup such as sweeping, vacuuming and hand pick-up.
- Designate a waste storage area on site. If a designated waste storage area is not feasible, remove wastes from the site regularly.
- Prohibit littering by employees, contractors and visitors.
- Trash receptacles with lids or weatherproof covers should be available on site and/or on construction vehicles.
- Cover or close lids of all waste containers at the end of each day and prior to rain.
- Protect wastes from being washed away by rain, storm water run-on, or other waters (irrigation, water line breaks, etc.).
- To prevent storm water run-on from contacting stored solid waste (stockpiled materials) use berms, secondary containment, covered dumpsters/roll-offs or other temporary diversion structure or measures (BMP 1-08 "Stockpile Management").
- For materials with the potential for spills or leaks, stockpile the material on impervious surfaces or on plastic groundcovers to prevent spills or leaks infiltrating the ground.
- Do not hose out or clean out dumpsters or containers at the construction site.
- Prevent solid waste and trash from entering and clogging storm drain inlets.
- As practical, incorporate any removed clean sediment and soil back into the project.

Maintenance and Inspection

- Collect site trash regularly, especially before rainy or windy conditions. Perform routine inspections of site, including storage areas, dumpsters, stockpiles and other areas where trash and debris are collected prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable).Close trash can lids and dumpster covers at the end of each day and before rainy or windy conditions.

What

Hazardous Materials/Waste Management is a procedural BMP for the use, control, containment, and disposal of hazardous materials and waste. This BMP is to be used in conjunction with SDG&E Environmental Standard (ES) G 8724 Hazardous Materials/Waste Management.

Examples of potential hazardous materials and waste requiring management control BMPs may include, but are not limited to:

- Petroleum products such as oil, fuel, grease, cold mix, and tar.
- Glues, adhesives, and solvents.
- Herbicides, pesticides, and fertilizers.
- Paints, stains, and curing compounds.
- Other hazardous or toxic substances.

When

Use this BMP during all phases of construction or operations and maintenance activity when the activity involves the storage and use of hazardous materials, or the generation of hazardous waste byproducts.

Where

All applicable construction and operations and maintenance activity sites where hazardous materials are used and/or hazardous waste is generated. A single instance of handling, use, or storage of a hazardous material or waste is sufficient to trigger this requirement.

How

Hazardous materials and hazardous wastes shall be managed in accordance with the following procedures:

- Only use products or materials onsite that have been approved through the SDG&E Product Approval process.
- Minimize the amount of hazardous materials stored at the site and the production and generation of hazardous waste at the site.
- Cover or containerize and protect from vandalism and exposure any hazardous materials and hazardous wastes.
- Clearly mark all hazardous materials and hazardous waste containers per the ES. Place hazardous waste containers in watertight storage sheds for hazardous waste containers. Alternately, use secondary containment systems, but watertight storage sheds are preferred when hazardous waste containers are stored at the construction site.
- Hazardous materials and hazardous waste containers must meet DOT type and specifications per the ES. The containers must be closed (hand tightened) during activity hours and securely tightened during non-activity hours.
- Stockpiled cold mix should be placed on and covered with plastic.
- Mixing of waste materials is strictly prohibited.
- Storm water that collects within secondary containment structures must be inspected prior to being discharged to ensure no pollutants, oil sheens or non-stormwater discharges are present.
- Spills cannot be discharged to the environment from secondary containment (see BMP 2-03 “Spill Control”).

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- All secondary containment systems for hazardous materials or hazardous wastes must be able to hold the volume of the largest container in the storage area and, if uncovered, sufficient additional capacity for storm events. A general rule of thumb for Southern California is that the additional containment volume for an anticipated rain event can be approximated by adding at least an additional four inches (a 4-inch rain) to the height of the containment sized for the entire waste volume of the largest container (Based on the Los Angeles Area 10 year, 24 hour precipitation frequency and a 24-hour manned facility). However, even within Southern California, this varies by the geographic region precipitation frequency and the hours of operation of the facility (containment inspection frequency). Consult with your Field Environmental Representative for determining the minimum volume required for the specific situation and geographical location.

- Hazardous waste must be segregated from other solid waste and stored and disposed of properly according to the ES. **Only company approved vendors with current contracts in place will be used to manage or dispose of hazardous wastes.**
- In addition to following this BMP and ES G8724, employees or contractors are responsible for compliance with federal, state, and local laws and regulations regarding storage, handling, transportation, and disposal of hazardous waste.

Maintenance and Inspection

- Routinely inspect the covers on hazardous material storage areas for tears or flaws and repair as necessary. Drums and drum storage areas are to be inspected at least weekly and the results recorded on an inspection log.
- All secondary containment systems for hazardous materials or hazardous wastes must be able to hold the volume of the largest container in the storage area and, if uncovered, sufficient additional capacity for storm events. A general rule of thumb for Southern California is that the additional containment volume for an anticipated rain event can be approximated by adding at least an additional four inches (a 4-inch rain) to the height of the containment sized for the entire waste volume of the largest container. Check with your Field Environmental Representative in the event you are unsure whether sufficient secondary containment exists for any facility.
- Inspect BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable) to ensure that no hazardous materials or waste are improperly left exposed to storm water. Immediately initiate repairs related to a storm event and no later than within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event.

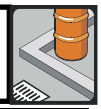
Fact Sheet WM-6

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Contaminated Soil Management is a procedural BMP for the control of contaminated soils, or soils suspected of being contaminated, that are encountered during site activities. Importation of fill shall also be managed in accordance with G8755 Import Fill Materials for Large Projects (>100 Cubic Yards), Projects within Coastal Zone, and Environmentally Sensitive Areas.

When

This contaminated soil management BMP should be used whenever soil is imported for fill, soil contamination is suspected, or when contaminated soil is encountered during construction or operation and maintenance "construction like" activities. Construction crews should be vigilant when projects are located in highly urbanized or industrial areas or in highway or roadway right-of-ways.

Where

All construction or "construction like" activity sites, but especially construction and operation and maintenance sites in urbanized or industrial areas where soil contamination may have occurred because of spills, illicit discharges, and leaks from underground storage tanks. Contaminated soils may also be encountered during digging and trenching activities on highway and roadway right-of-ways.

How

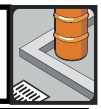
Contaminated soil (including soil import that may be contaminated) should be managed in accordance with the following procedures:

- Identify contaminated soil by looking for the following:
  - Soil that is discolored, black, gray, white; or
  - Soil that has an unusual odor, such as, petroleum, acid, alkaline, sewage, solvent, or any other chemical smell.
- If any potentially contaminated soil is detected, immediately discontinue the activity and contact the project's Field Environmental Representative.
- The CGP requires that the discharger sample and test contaminated soils to ensure proper handling and notify the appropriate local, State and federal agencies, as well as the appropriate Regional Water Board if there is a reportable release event. A reportable release is a discharge or release of oil, hazardous materials or wastes, hazardous substances or chemicals in quantities that may be harmful to the public health. This includes non-stormwater discharges of any kind into the stormwater conveyance system.
- Contaminated soils must also be managed properly per SDG&E Environmental Standards (ES). See ES G8729; G8724; and G8755.

Maintenance and Inspection

- Inspect all imported fill for contamination per Environmental Standard G8755.
- Perform routine inspections of digging and trenching operations during construction and operation and maintenance activities looking for contaminated soils in addition to normal BMP inspections prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Immediately initiate repairs related to a storm event no later than within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- All contaminated soils must be managed properly in accordance with applicable federal, state, and local laws and regulations.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



Corresponding CASQA Fact Sheet Fact Sheet WM-7

What

Sanitary/Septic Waste Management is a procedural BMP for the control of sanitary/septic wastes. Sanitary/Septic waste is domestic (human) waste.

When

When construction or operation and maintenance site location requires onsite sanitary/septic waste portable toilets, or hand wash/rinse stations, or shower units.

Where

All applicable construction and field operations and maintenance sites.

How

Sanitary/septic wastes shall be managed in accordance with the following procedures:

- Incorporate into regular safety meetings the education of employees, contractors, and suppliers on:
  - Potential dangers to humans and the environment from contact with sanitary/septic wastes due to bacteria, viruses, and parasites.
  - Approved sanitary/septic waste storage and disposal procedures.
- Use only reputable, licensed sanitary/septic waste facility providers and haulers for sanitary facilities (portable toilets, hand wash stations, shower units) and their transportation to and from the construction site.
- Ensure that sanitary facilities are equipped with secondary containment to prevent discharge of pollutants to the storm water drainage system or receiving water.
- Sanitary facilities should be located away from drainage systems and watercourses, minimizing the likelihood of leaks or spills contaminating waterways.
- Sanitary facilities should be located away from highways and roadways to avoid vehicles colliding with the sanitary units.
- When subjected to high winds, risk of high winds, or risk of vandalism, sanitary facilities shall be secured to prevent overturning.
- Sanitary wastewater should not be buried or discharged, except to a properly permitted sanitary sewer discharge facility. A permit may be required from the local Sanitation District.
- Temporary sanitary facility's holding tanks shall be emptied by a licensed waste hauler prior to transport.

Maintenance and Inspection

- Perform inspections of sanitary facilities and BMPs routinely prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Ensure that sanitary/septic facilities are maintained in good working order and routinely serviced by a licensed service.
- When servicing of portable sanitary facilities is conducted, wash/rinse water shall, not be allowed to runoff and shall be collected and disposed of properly in accordance with federal, state, and local requirements.

What

Non-hazardous Liquid Waste/Drilling Fluid Management is a procedural BMP for managing non-hazardous liquid wastes on a construction or operation/maintenance activity site.

Hazardous liquid wastes, including water with an oily sheen, should be managed using BMP 2-05 "Hazardous Materials/Waste Management."

Dewatering operations, and concrete slurry residue should be managed according to BMP 3-01, and BMP 3-05, respectively.

Non-hazardous Liquid wastes include, but are not limited to:

- Drilling slurries/muds and fluids, and waste water and rinse water without an oil sheen (including pressure washing).
- Dredging spoil, and non-storm water liquid discharges that do not have discharge permits.

When

Liquid waste management is applicable when construction projects and operations and maintenance activities generate any non-hazardous liquid byproducts, residuals,, or wastes.

Where

All applicable construction and operations and maintenance sites where non-hazardous liquid waste is present.

How

- Vehicle and equipment cleaning using water is discouraged on site. If washing is required for safety or for the work, utilize BMP 3-03 "Vehicle and Equipment Washing."
- Drilling residue and drilling fluids should be disposed of in accordance with federal, state and local requirements. Coordinate the disposal of these wastes with your Field Environmental Representative.
- Wastes generated as part of a construction, operation, or maintenance procedure, such as water laden with dredged material and drilling mud should be contained and not allowed to flow into drainage channels, storm drains, or receiving waters.
- Contain non-hazardous liquid wastes in a controlled area and manner, such as a lined pit, lined roll-off bin with a sealed bottom, or a portable tank.
- Storage tanks used for collecting and settling non-hazardous water shall be routinely checked for leaks and to ensure they are not overfilled.
- Piping used to connect storage tanks shall be routinely checked to ensure connections are secure and not leaking.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated and, if uncovered, any additional volume needed for anticipated precipitation. A general rule of thumb for Southern California is that the additional containment volume for an anticipated rain event can be approximated by adding at least an additional four inches (a 4 inch rain) to the height of the containment sized for the entire waste volume. Contained material must be routinely removed and properly disposed of in accordance with federal, state and local requirements.

- **Do not locate containment areas or devices where accidental release of the contained liquid can threaten health or safety, or discharge to watercourses, storm drain system, or to a water body.**
- Capture all liquid wastes running off a surface including wash water and rinse water from cleaning walls or pavement, including pressure washing.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- If the liquid waste is sediment laden, use a sediment trap (see BMP 1-10) or capture in a containment device and allow sediment to settle.
- Disposal of liquid wastes are subject to specific laws and regulations, or to requirements of other permits secured for the construction project. Contact your Field Environmental Representative for further information.

Maintenance and Inspection

- Remove deposited solids from containment areas and containment systems as needed, and at the completion of the project. Soil, dredged material and drilling mud to be transported offsite for reuse or disposal must first be profiled using chemical analysis. Liquid waste disposal may also need to be profiled prior to transportation and disposal. Contact the Field Environmental Representative as far in advance of the anticipated transportation need as possible.
- Inspect containment systems routinely for damage, and repair as needed.
- BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.

Section 3 – Non-Storm Water Discharge Controls

What Is Non-Storm Water?

Non-storm water is any water that does not originate as rain or snowmelt, or is rain or snowmelt that has come into contact with pollutants caused by human activities at construction and industrial sites, and commercial and residential sites.

Why Are Non-Storm Water Discharge Controls Required?

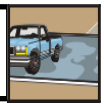
Storm water conveyance systems (natural or manmade, wet or dry) are, by regulation, for conveying storm water or exempt or permitted non-storm water discharges only. Storm water conveyance systems eventually discharge to natural water bodies. Non-storm water, which may reach these storm water conveyance systems, may contain pollutants, such as sediment, that are harmful to the natural water bodies. Also, sediment from construction sites can clog storm water systems or reduce the volume of storm water that can be handled by the storm water system.

What Are Non-Storm Water Discharge Controls?

Non-Storm Water Discharge Controls include general site and operations BMP measures that minimize pollution of water. Non-Storm Water Discharge Controls presented in this Manual include the following:

- BMP 3-01 Dewatering Operations
- BMP 3-02 Paving Operations
- BMP 3-03 Vehicle and Equipment Washing
- BMP 3-04 Vehicle and Equipment Fueling
- BMP 3-05 Concrete/Coring/Saw Cutting and Drilling Waste Management
- BMP 3-06 Dewatering Utility Vaults
- BMP 3-08 Over-Water Protection
- BMP 3-09 Paint Removal Control
- BMP 3-10 Stream Crossings
- BMP 3-11 Clear Water Diversion

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Dewatering Operations is a procedural BMP for controlling construction or operations and maintenance dewatering to assure regulatory compliance.

When

- This BMP is applicable when groundwater from an excavation, trench, or non-storm water from a pipeline hydrostatic test must be removed.
- When excavation/trench dewatering, also see Environmental Standard (ES) 104.0226.
- When dewatering hydrostatic test water, also see ES 104.0220.

- **This BMP is not Applicable to drilling mud or similar products used in drilling foundations (see BMP 2-08 "Non-hazardous Liquid Waste/Drilling Fluid Management")**
- **This BMP is not applicable to utility vault or sub-structure dewatering. For these applications, refer to the BMP 3-06 "Dewatering Utility Substructures and Vaults."**
- **This BMP is not applicable when the water is known, or suspected to be, contaminated. Under these conditions, contact your Field Environmental Representative.**
- **Water from dewatering operations cannot be discharged to the sanitary sewer, storm drain systems, drainages, creek beds (even if dry), or to water bodies without a permit. This prohibition includes groundwater dewatering to these conveyance systems or water bodies (groundwater may contain pollutants not easily detected except by analytical laboratory tests).**
- **Groundwater from excavation or trench dewatering or hydrostatic test water cannot be discharged to land without a permit or permit waiver. Groundwater and hydrostatic test water may contain pollutants not easily detected except by analytical laboratory tests.**
- Non-contaminated discharges of water from hydrostatic tests of new pipe utilizing potable water as a water source, reused for soil compaction and dust control, or reused for agricultural irrigation may be allowed to be discharged to land without a permit or under a permit waiver, depending on the local and regional regulatory requirements. Consult with your project Field Environmental Representative for permitting applicability prior to planning a discharge.

Where

All construction sites and operations and maintenance activity sites that require excavation or trench dewatering, or pipe hydrostatic test discharges.

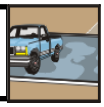
How

Water generated by dewatering activities should be managed in accordance with the following procedures:

- If allowed by regulations, permit, or the regulating agencies, use the water for construction activities such as onsite soil compaction and dust control. If used for these applications, ensure that the water does not run-off to storm drain systems, drainages, creek beds (even if dry), or to water bodies.
  - The water may contain uncontaminated sediments, but the water must not be contaminated with other pollutants.

  Note: Discharge to land for site compaction, dust control or for infiltration (to groundwater) may require a permit or permit waiver to discharge from the Regional Water Quality Control Board (RWQCBs) and/or local jurisdictions (such as Flood Control District). Consult with your Field Environmental Representative.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



How (cont.)

- If allowed by regulations, permit, or the regulating agencies, water from dewatering, that contains only uncontaminated sediment, may be discharged to one of the following:
  - To land for infiltration (also see soil compaction and dust control above). In some locations, a permit may be required from the RWQCB and/or a local jurisdiction (such as a Flood Control District). Consult with your Field Environmental Representative. The permit may allow sediment without settling or filtration. The permit may specify limits on other pollutants, requiring sampling and analysis, and submittal of analysis results prior to discharge approval. If allowed by regulations, permit, or the regulating agencies, infiltrate to an appropriate landscaped, vegetated, or soil area. If used for these applications, ensure that the water will infiltrate and not run-off to storm drain systems, drainages, creek beds (even if dry), or to water bodies. Land owner permission to discharge to land for infiltration is required.
  - To the Sanitation or Wastewater District Sanitary/Industrial Sewer - Requires a permit or approval of the above wastewater authority. District may require sampling and analysis and a Batch Discharge application (application for a short-term discharge of a stated volume) prior to approval. District may set a numeric limit on the amount of acceptable sediment discharged. District may require a fee, dependent on discharge volume and pollutant load.
  - To Surface Water (including storm drains) - A RWQCB discharge permit is required and a local jurisdiction permit (such a Flood Control District permit) may be required. Consult with your Field Environmental Representative. The permit may specify limits on sediment and other pollutants, require sampling and analysis, and the submittal of analysis results prior to discharge approval. These permits take advanced planning.
    - A surface water (including storm drains) discharge permit may have a numerical limit on the concentration of Total Suspended Solids (sediment) that can be discharged and a restriction limiting an increase in turbidity of the receiving water. Other pollutants, such as Oil and Grease (O&G) and Total Petroleum Hydrocarbons (TPH) may also have stringent numerical limits. As a minimum, contaminant-free temporary storage (Baker tanks) may need to be provided until permit coverage is obtained and sampling and analysis can be completed. A properly sized sediment clarifier and petroleum hydrocarbon treatment may be required. The cost of this potential treatment for discharge to surface waters should be compared to the treatment cost of discharging to the sanitary sewer (if logistically feasible) before deciding on this discharge option.
- Transport for Disposal in a Vacuum Truck for Proper Disposal. This option is usually the most expensive option and only utilized when the discharge options above cannot be permitted or is otherwise infeasible.
- If a permit is obtained for discharge to a storm water or sanitary sewer system, conduct all dewatering discharge activities in accordance with permit requirements, including installation of appropriate BMPs.
- Dewatering records should be maintained in accordance with permit requirements.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection

- Inspect pumps, hoses and all equipment before use to ensure they are in proper operating condition and free of contamination. Monitor dewatering operations to ensure it does not cause offsite discharge or erosion.
- Monitor the discharge for any change in characteristics (amount of sediment, oil sheen, color, etc.) that is not permitted. Stop the discharge immediately if there is a visual indication that the permit conditions are being exceeded.
- BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Sample dewatering discharges in accordance with permit requirements, if applicable.
- These operations and equipment should be made secure.

Pictures

What

Paving Operations is a procedural BMP for controlling non-storm water discharges associated with pavement surfacing or resurfacing, patching, or pavement removal.

Paving Operations activities may typically utilize the following materials:

- Cold mix,
- Asphalt,
- Chip Seal, Seal Coat, Tack Coat, Slurry Seal, Fog Seal, and
- Portland Cement Concrete.

For pavement grinding, saw cutting, coring or drilling, refer to BMP 3-05 "Concrete/Coring/Saw cutting and Drilling Waste Management."

When

Use this BMP whenever paving operations are being conducted.

Where

All construction or operations and maintenance work sites that have paving activities.

How

Use the following methods as applicable:

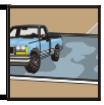
- Protect storm drain inlets near work and down gradient of the area to be paved (see BMP 1-06 "Storm Drain Inlet Protection").
- If onsite mixing is planned, an area must be designated for conducting the mixing. This area should already be paved or made impervious (e.g., plastic or wood sheeting) and be located away from storm drain inlets, drainages, or watercourses.
- Minimize overspray of tackifying emulsions or placement of other paving materials beyond the limits of the area to be paved. Schedule the application of tackifying agents according to manufacturer's instructions regarding rain events.
- Use dry methods to clean equipment and conduct cleaning in accordance with BMP 3-03 "Vehicle and Equipment Washing."
- Material use and stockpiles are to be managed in accordance with BMP 2-02 "Material Use" and BMP 1-08, "Stockpile Management."
- Collect and remove all broken asphalt and concrete, recycle when feasible, and dispose of materials in accordance with local, state, and federal requirements.

- **Do not apply asphalt, concrete paving, seal coat, tack coat, slurry seal or fog seal if rain is expected during the application or curing period.**
- **Avoid if possible, the transferring, loading, or unloading of paving materials near storm drain inlets, drainages, or watercourses. If not possible, use BMP 1-06 "Storm Drain Inlet Protection."**
- **CGP Risk Level 2 & 3 projects, that construct concrete structures onsite or store concrete mixing materials onsite, are subject to pH Numeric Action Levels (Risk 2) or pH Numeric Effluent Limits (Risk 3) for those drainage areas of the project where the concrete construction or storage of concrete mixing or waste materials take place.**
- **CGP Type 2 & 3 projects are subject to pH Numeric Action Levels (Type 2) or pH Numeric Effluent Limits (Type 3) for active areas.**

Maintenance and Inspection

- Inspect and maintain equipment and machinery routinely to minimize leaks.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



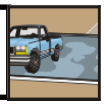
Maintenance and Inspection (cont.)

- Inlet protection BMPs prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.

Corresponding CASQA Fact Sheet

Fact Sheet NS-3

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Vehicle and Equipment Washing is a procedural BMP for controlling vehicle and equipment washing on construction or operation and maintenance activity sites.

When

Onsite washing of vehicles and equipment on sites shall only be conducted when prior authorization has been received from the field Environmental Representative. Use this BMP on all sites when vehicle and equipment cleaning is being performed. Note that construction site vehicle and equipment washing is not typically performed on utility type construction sites unless required by safety considerations, or is necessary for work completion.

Where

Applicable to all construction and operation and maintenance sites where equipment or vehicles are washed.

How

Use the following methods as applicable:

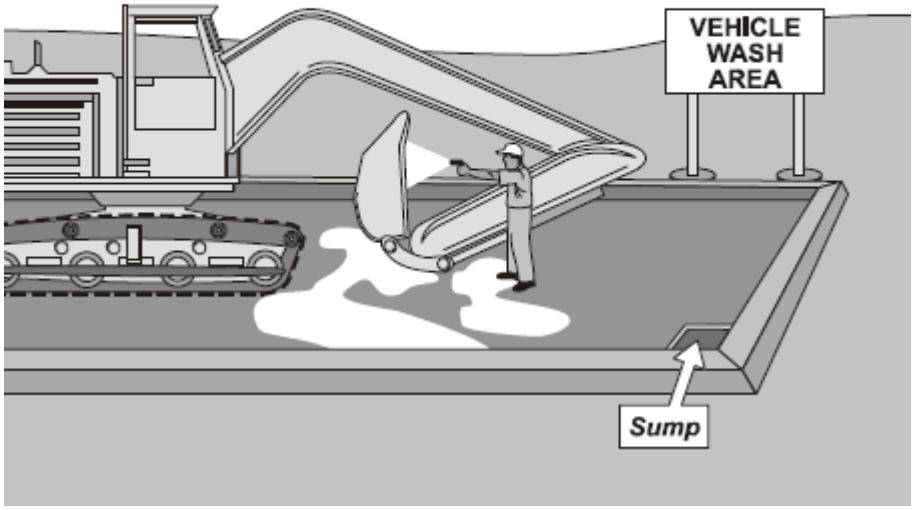
- Use dry cleaning methods such as wiping down, rather than water washing vehicles or equipment.
- If onsite vehicle washing is authorized by the Field Environmental Representative, use the following general methods:
  - Vehicle and equipment washing must be located away from storm drain inlets, drainage systems, or watercourses.
  - Place secured impermeable liners, sand bags or another type of berm around storm drain inlets and drainage systems to prevent wash water from entering a storm inlet, drainage system or watercourse. Secured, impermeable liners are preferable to sand bags. Sand bags are preferable to gravel bags. Sand bags are preferable to gravel bags because they are less porous, and are much better at preventing water and pollutants from passing through the barrier.
  - Never discharge wash water to the storm drain system, drainages, watercourses, or water bodies.
  - Use as little water as possible. High-pressure sprayers may use less water than a hose.
  - Use a positive shutoff valve to minimize water usage.
  - Collect all wash and rinse water for proper disposal.

Maintenance and Inspection

Monitor employees and contractors through the duration of the construction project to ensure appropriate practices are being implemented.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

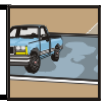
Pictures



Corresponding CASQA Fact Sheet

Fact Sheet NS-8

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



What

Vehicle and Equipment Fueling is a procedural BMP for controlling vehicle and equipment fueling at construction and operation and maintenance activity sites.

When

Use this BMP for construction and operation and maintenance activity sites when onsite fueling of vehicles and equipment, including handheld equipment, is planned or conducted.

Vehicle and equipment fueling, except for handheld equipment, is typically not done on a construction site. Onsite fueling of vehicles and equipment may be planned if it is impractical to send vehicles and equipment off site for fueling.

Handheld equipment is treated separately from other equipment. Handheld equipment includes those smaller, manually operated pieces of equipment such as trenchers, mowers, chainsaws, generators, and other equipment that need fueling during regular daily operation.

Where

All construction and operation and maintenance activity sites where vehicle and equipment fueling occurs.

How

- If practical, fuel vehicles and equipment off site.
- Mobile fueling equipment is the preferred equipment used for construction site fueling.
- Fuel storage and fueling areas should be located away from storm drain inlets, drainage systems, watercourses, and water bodies.
- All fueling will be conducted with the fueling operator in attendance at all times regardless if fuel nozzles are equipped with automatic shutoff features.
- Fuel tanks should not be "topped off."
- All fueling operators should have readily available spill containment and cleanup equipment and materials.
- Clean up spills immediately and properly dispose of contaminated materials.
- Properly store and dispose of rags and absorbent material used to clean up spilled fuel.
- Mobile fueling trucks and operators must have all necessary permits, licenses and training.

Maintenance and Inspection

- Check to ensure that there is an adequate supply of spill cleanup materials available.
- Perform routine inspections of designated fueling areas and inspect vehicles and equipment for leaks.
- Report all spills immediately to the project Supervisor ***and/***or the Field Environmental Representative.

What

Concrete/Coring/Saw Cutting and Drilling Waste Controls are procedural BMPs for the proper management of liquid and solid wastes from concrete/coring/saw cutting and drilling activities.

For managing any concrete curing compounds, also use BMP 2-05 "Hazardous Materials/Hazardous Waste Management." For managing paving operations, use BMP 3-02.

When

Use this BMP at construction and operation and maintenance activity sites when the activity utilizes concrete and asphalt or when slurry or pavement/concrete wastes are generated by the activities, including:

- Saw cutting.
- Coring/drilling.
- Grinding, re-paving or patching.
- Encasing conduit in concrete.
- Tower footings.

Where

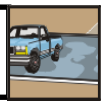
All construction and operation and maintenance activity sites where the above activities are conducted.

How

- Install storm drain protection at any down-gradient inlets that may be impacted by the activity per BMP 1-06 "Storm Drain Inlet Protection."
- Minimize the amount of water used during coring/drilling or saw cutting. During wet coring or saw cutting, use a wet vacuum to lift the slurry from the pavement as the coring or saw cutting progresses. Additionally, sand bag barriers or other containment should be used at nearby down gradient storm drain or drainage inlets per BMP 1-06 "Storm Drain Inlet Protection."
- If concrete residue remains after drying, the area should be swept in a timely manner and residue removed to avoid contact with storm water or entering a storm drain or water body via the wind. If concrete residue still remains, pressure wash the surface, with in-progress vacuum recovery of wash water to remove residual material.

- **Do not wash residue or particulate matter into a storm drain or drainage inlet or a watercourse or water body.**
- The following options should be used for concrete truck chute and/or pump and hose washout:
  - If available, arrange to use an existing concrete washout station. Upon entering the site, concrete truck drivers should be instructed about proper site practices.
  - **Concrete Washouts:** Washout stations can be: self contained concrete trucks; commercial portable washout stations (rent-a-washout); plastic lined temporary pits, or a bermed and lined area designed with sufficient volume to completely contain all liquid and waste concrete materials plus enough capacity for rainwater. The lining must be impervious (such as Visqueen with no holes or tears). The designated area must be located away from storm drain inlets, drainages, watercourses, or water bodies.
  - **Washout in Trench:** Manually rinse the concrete truck chute into the lined trench itself. Note that this practice is not allowed on CGP projects, where minimum BMPs in the permit require containment of concrete washout areas and prohibits discharge into the underlying soil or surrounding areas. Check with the Field Environmental Representative regarding site-specific applicability.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



How (cont.)

- **Bucket Washout:** Manually rinse the chute into a wheelbarrow, plastic bucket or pail, and then empty the bucket into the concrete truck barrel or on top of the placed concrete within a trench or excavation. Prevent or protect against spillage, and clean up any spillage promptly.

- **CGP Risk Level/Type 2 & 3 projects, that construct concrete structures onsite or store concrete mixing materials onsite, are subject to pH Numeric Action Levels (Risk/Type 2) or pH Numeric Effluent Limits (Risk/Type 3) for those drainage areas of the project where the concrete construction or storage of concrete mixing or waste materials take place.**

Maintenance and Inspection

- Responsible personnel should ensure that all drivers of concrete trucks arriving onsite are instructed about proper project practices.
- Clean out designated washout areas as needed or at a minimum when the washout is 75 percent full to maintain sufficient capacity throughout the project duration. Add additional designated areas as necessary and available to maintain capacity.
- Any designated onsite washout areas must be cleaned out and all debris removed upon project completion. Dispose of concrete waste according to BMP 2-04 "Solid Waste Management."
- Inspect routinely, when washout activities are underway to ensure the integrity of the concrete washout lining and that the concrete washout does not overflow.

What Dewatering Utility Vaults is a procedural BMP for controlling water from dewatering utility vaults and underground structures. This BMP does not apply to trench, excavation or other general dewatering associated with construction activities, which is covered by BMP 3-01.

When This BMP is applicable whenever water must be removed from SDG&E utility vaults and underground structures.

Where All SDG&E utility vault locations.

How The discharge of clean water from dewatering of vaults and underground structures to the storm drain, drainages, or water bodies is allowed under the statewide General NPDES Permit for Discharges from Utility Vaults and Underground Structures to Surface Waters (Order No. 2006-0008-DWQ and NPDES No, CAG990002).

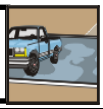
Discharges to land (e.g., vegetation, bare soil area) are not covered by this permit. A Waste Discharge Requirements (WDR) permit or waiver may be required by the local Regional Water Quality Control Board (RWQCB) for discharges to land. If a RWQCB does not have a general WDR or waiver for discharges to land, then the State Water Resources Control Board (SWRCB) General Permit for dewatering to land may apply. Consult with your Field Environmental Representative. Discharges to land also require the prior approval from the landowner.

General requirements for discharge under Order 2006-0008-DWQ/Permit Number CAG990002) are listed below:

- All vault dewatering discharges conducted by utility crews, including contractors, shall follow the latest version of SDG&E's Environmental Standards (ES) on Vault and Underground Structure Dewatering. For dewatering utility gas/electric vaults & underground structures follow ES http:/techdocs.sempra.com/doclib.nsf/docframe?openform&docno=G8718.
- Prior to discharge, the water in the vault shall be assessed in accordance with the requirements in the ES.
- A SDG&E-approved filter system with hydrocarbon removal capability is required to be used on the pump discharge for compliance assurance when dewatering to a surface water (drainage, gutter, storm drain inlet, or a water body).

- **If the water to be discharged is Clear Water as described in the ES, then the discharge to storm drains, drainages, or water bodies is acceptable as long as the discharge does not cause nuisance or harm to the environment.**
- Water discharged to the street, gutter, drainages, watercourses, or water bodies must be clean and clear, with no evidence of oil sheen and no chemical or sewage smell.
- The dewatering discharge must be monitored at all times during the discharge to ensure the discharge is "clean and clear" with no chemical or sewage odor. If the characteristics of the discharge change (i.e., color, smell, sheen), the discharge must be stopped immediately. In such an event call the Field Environmental Representative.
- Whenever possible, discharge the clean, clear water directly to the storm drain, drainage, or water body to avoid pre-existing pollutants in the discharge path. Pre-existing soil or contaminants in the path of the discharge (i.e., gutter) that can discolor/contaminate the discharge need to be cleaned up before discharging vault water.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.



How (cont.)

- **The discharge from the filter system must be clean and clear at all times, and if not, the discharge must be stopped.**
- As a last resort, when the water, because of sediment or pollutant contamination, cannot be discharged to the environment, contact the project Field Environmental Representative for transport of the water in an approved manner (see the linked SDG&E ES from the previous page).

Maintenance and Inspection

- Implement applicable provisions of the ES.
- Inspect pumps, hoses, filter system and equipment before use and routinely when applicable activities are underway.
- Observe dewatering activities to ensure they do not cause erosion or discharge of potential pollutants.

Corresponding CASQA Fact Sheet

Not applicable. See also Fact Sheet NS-2, Dewatering Operations

What

Over-Water Protection is a procedural and containment system BMP for protecting watercourses from overhead construction and maintenance and repair activities.

- Over-water construction and maintenance activities include, but are not limited to, chipping, grinding, scraping, welding/burning, painting, wrapping and coating of pipes and conduits.
- Watercourses (dry or wet) include drainages, creeks, streams, rivers, lakes and wetlands, bays, estuaries and oceans.

When

This BMP applies to projects when:

- Construction, maintenance or repair activities will be conducted above watercourses (dry or wet).

Prior to conducting over-water activities, check with the Field Environmental Representative for the possible need for permits with the appropriate local and state agencies. As an example, the design or installation of a containment system may itself impact the watercourse and require a permit, or the timing of the activity may impact wildlife breeding seasons, requiring a permit or preventing the activity during certain portions of the year.

Where

All construction or operation and maintenance activity above any portion of a watercourse.

How

Use the following measures as applicable:

- Containment systems must be properly designed and installed prior to the beginning of any operation that may impact a water body to prevent discharge of pollutants to surface waters, taking into account the construction or maintenance activity and factors such as wind, rain, etc.
- The work area should be kept clean of all trash and potential pollutants.
- Containment booms should be placed around the area of work as necessary to contain the discharge of potential contaminants such as oil and hydraulic fluid.
- Special attention should be given to existing and forecasted wind and weather conditions to prevent pollutant discharges to surface waters.
- Shrouds of appropriate material should be used to prevent paint overspray, welding slag, and other pollutants from entering surface waters. Shrouding may not be effective during periods of high wind.
- Shrouds should be large enough to adequately enclose or segregate the working area from surface waters. This may include a plywood barrier, Visqueen, and scaffolding to help prevent fugitive material from entering surface waters.
- Support structures such as scaffolding shall be used in conjunction with shrouding to withstand potential wind stress.
- Contaminated shrouding material and equipment shall be thoroughly cleaned or disposed of properly.

Maintenance and Inspection

- Inspect the containment systems, shrouds, and support structures prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable) to ensure their integrity and safety. Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event.

What

Paint Removal Control is a procedural BMP for protecting storm water and water courses from mark-out paint or graffiti paint removal activities.

When

Use this BMP when utility activities have used mark-out paint on surfaces and the paint is required to be removed by local jurisdictions or another authority, or when graffiti on company property is discovered and must be removed.

Where

Mark-out paint is usually used on road, sidewalk, and land surfaces to show the location of underground utility services. Graffiti on company property may have been painted on company fences or walls, buildings, walkways, curbs or other surface.

How

Use the following options to remove mark-out paint or graffiti:

- Use non-toxic, light degradable mark-out paint when possible.
- Avoid the use of chemical paint removers whenever possible. When chemical paint removers are required, only use products that have been approved through the product review process and utilize containment and wet vacuuming of material during the removal process.
- Hydro pressure wash.
- Dry abrasive blast/grinding.
- Wet abrasive blast/grinding.

Use one or more of the following methods to promptly and effectively contain and remove paint and residues in order to protect storm water sewers, drainages and watercourses:

- Dry sweep.
- Install storm drain inlet protection at down gradient inlets during hydro pressure washing, wet abrasive blasting, grinding, and chemical removal. Discharge of any wet or dry residuals or wash water to the drainage system is prohibited.
- Minimize the amount of water used during hydro pressure washing.
- Wet or dry vacuum.
- Use wet vacuum to lift the paint slurry from the pavement or surface as hydro pressure washing progresses or as soon as possible, and before the material has a chance to migrate from the work area.
- If wet vacuuming is not adequate to capture all wastewater from these activities, use additional containment (sand bags, booms, or other containment devices) methods as near the work area as possible to prevent the discharge to a street, gutter, storm drain/drainage inlet, or watercourse.
- If paint residue remains after drying, the area should be swept up and residue removed in a timely manner to avoid contact with storm water.
- If paint residue remains after sweeping, the area can be water washed, as long as the water containing the paint residue is contained near the work and wet vacuumed and not allowed to enter storm drain inlets or watercourses.
- All waste should be disposed of using the BMP 2-08 "Non-Hazardous Liquid Waste Management."

Maintenance and Inspection

- Inspect all containment systems to ensure proper placement prior to starting utility paint removal operations.
- Inspect equipment frequently and adjust as necessary to maximize efficiency and minimize water or other material use of the paint removal

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

operations.

What

A stream crossing is a culvert, ford, or bridge placed across a waterway to provide access for construction or operations and maintenance activities. Utility stream crossings are not intended to maintain public traffic and project-specific permits may be required for use (see "Limitations"). The crossing design and construction allows safe access and reduces erosion and downstream sediment from vehicles.

The project Field Environmental Representative should be consulted for any permit requirements and for the stream crossing location.

The following types of stream crossing should be considered:

- **Culverts:** Appropriate to control erosion, but may cause erosion during installation/removal without appropriate BMP measures. Easily constructed and allows for heavy equipment loads.
- **Fords:** A ford is a streambed crossing alternative that involves crossing a waterbody at grade, on a hard surface maintained at the streambed bottom. Appropriate during dry weather and in arid areas in dry washes, ephemeral streams, and low-flow perennial streams. Ford crossings generally involve the placement of gravel or other non-erodible material to facilitate crossing and are appropriate for streams that would benefit from additional clean native or compatible gravel; for example, salmonid streams or rivers below reservoirs, and urban, channelized streams. Fords provide minimum sediment and erosion control in a stream channel and are most appropriate when the potential for stream channel erosion and dislodgement of sediment due to the addition of the material and traffic is low. A ford is the least expensive stream crossing, allows for maximum load limits, and offers very low maintenance. Fords may degrade water quality due to vehicle and equipment contact. Direct placement of gravel may be appropriate for short-term use. In addition, soil-confinement systems can also be used in low-flow intermittent stream crossings for ease with implantation and removal. Examples include:
  - Cellular Confinement Systems (CCS) crossings consist of three-dimensional cellular-type material placed on the streambed bottom and filled with rock or soil. CCSs are an effective option when used in conjunction with ford crossings because it is sufficient to support most construction equipment and is readily removable.
  - Articulated concrete mats (e.g., concrete blocks held together by steel cable or interlocking concrete blocks) can also be used for fording a stream. Articulated concrete mats can be used to harden the streambed for crossing. Gravel should be placed on the mats to fill in the voids between concrete blocks.
  - Gabion mattresses consisting of rock contained in rectangular, wire-mesh can also be used for constructing a hard driving surface. Gabion mattresses are strong and durable, flexible structures, and are easily constructed.
- **Bridges:** Appropriate for streams with high flow velocities, steep gradients, and where temporary restrictions in the channel are not allowed. Bridges are more expensive to design and construct, but provide the least streambed disturbance and waterway flow constriction.

What

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

(cont.)

Limitations:

- Installation may cause a waterway constriction, which can obstruct flood flow and cause flow backups, washouts, and/or scouring.
- **Installation may require RWQCB 401 Certification, USACOE 404 permit and approval by the California Department of Fish and Game. If numerical water quality standards are mentioned in any permits, sampling and testing may be required.**
- Installation and removal will usually disturb the waterway, and may require dewatering or temporary stream diversion.
- Soil confinement systems used for stream crossings must be constructed in accordance with the manufacturer's specifications, and inspected and maintained for structural integrity.
- Gravel use in the stream for soil-confinement system crossings will require agency approval.
- Requires other BMPs to minimize soil disturbance during installation and removal.

When

Stream crossings are installed at sites when:

- Appropriate permits have been secured for activities and for the stream crossing.
- Construction or operation and maintenance equipment or vehicles need to frequently cross a waterway.
- Alternate access routes impose significant constraints.
- Crossing perennial streams or waterways without a stream crossing causes significant erosion.

Where

Stream crossings should be installed at all designated crossings of perennial and intermittent streams and in dry channels that may be significantly eroded by construction or operation and maintenance traffic at locations where:

- Erosion potential from the installation is low.
- Site runoff is not directed towards the crossing in a manner that promotes erosion of the crossing.

How

Minimum standards and specifications for the design, construction, maintenance, and removal of the structure should be established by a California Registered Civil Engineer, and for bridges, a California Registered Structural Engineer. The design flow and stability safety factor should be based on risk evaluation of overtopping, flow backups, or washout.

Construction and Use:

- Install sediment traps immediately downstream of the crossings to capture sediment. Sediment traps may also be required to be part of the crossing permit. For CCS ford crossings, the gravel depth should be 6 to 12-inches to support construction vehicular traffic. Clean, washed, angular or rounded gravel should be used with cellular-block confinement systems.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

- Avoid oil or other potentially hazardous materials for surface treatment.

How (cont.)

- Stabilize construction roadways, work area, and streambed bottom against erosion. Stream bed and bank stabilization, if necessary, may also be required to be part of the crossing permit.
- Construct during dry periods to minimize stream disturbance and reduce costs.
- Construct at or near the streambed elevation to prevent potential upstream flooding.
- Install erosion control BMPs to minimize erosion of embankment into flow lines.
- Any artificial obstruction placed within flowing water should only be built from material that will not introduce sediment or silt into the watercourse.
- Vehicles and equipment should not be driven, operated, fueled, cleaned, maintained, or stored in the wet or dry portions of a water body. Wetland vegetation, riparian vegetation, or aquatic organisms could be destroyed.
- The exterior of vehicles and equipment that will encroach on the water body should be maintained free of grease, oil, fuel, and residues.
- Drip pans should be placed under all vehicles and equipment placed over water bodies (e.g., bridges) when the equipment is planned to be idle for more than one hour.
- Disturbance or removal of vegetation should not exceed the minimum necessary to complete operations. Disturbed vegetation should be replaced with the appropriate soil stabilization measures.
- Riparian vegetation, when removed pursuant to the work provisions, should be cut off no lower than the ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation should be covered by a sufficient layer of clean river run cobble to prevent damage to the underlying soil and root structure. The cobble must be removed upon completion of project activities.

Maintenance and Inspection

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect prior to and after each storm event, daily during extended rain events during the construction and/or clean-up activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Check for blockage in the channel, sediment buildup or trapped debris in culverts, blockage behind fords or under bridges.
- Check for erosion of abutments, channel scour, riprap displacement, or other signs of erosion.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

- Check for structural weakening of the crossings, such as cracks, and undermining of foundations and abutments.

Maintenance and Inspection (cont.)

- Remove sediment that collects behind fords, in culverts, and soil confinement systems. Removal of undesirable sediment may be required to be part of the crossing permit.
- Replace lost or displaced support aggregate from inlets and outlets of culverts and soil confinement systems.
- With proper BMPs, remove temporary stream crossings promptly when it is no longer needed.

What

Clear water diversion is a system of structures and measures that intercept clear surface water runoff upstream of a construction project or operation and maintenance activity, transport it around the work area, and discharge it downstream with minimal water quality degradation. It encloses a construction area in a waterway and reduces sediment pollution from construction in, or adjacent to water. Structures commonly used as part of this system include diversion ditches, berms, dikes, slope drains, rock, gravel bags, wood, aqua barriers, cofferdams, filter fabric, or turbidity curtains, drainage or interceptor swales, pipes, or flumes.

Limitations:

- Diversion activities will usually disturb the waterway during installation/removal.
- Installation may require RWQCB 401 Certification, USACOE 404 permit and approval by California Department of Fish and Game. If numerical water quality standards are mentioned in any permits, sampling and testing may be required.
- Diversion activities may constrict the waterway, obstruct flood flows, and cause flooding or washouts. Diversion structures should not be installed without identifying potential impacts to the stream channel.
- Diversion or isolation activities are not appropriate in channels where there is insufficient stream flow to support aquatic species in the dewatered area or if they will disturb sensitive aquatic species.
- Diversion or isolation activities are inappropriate in deep water unless designed and reviewed by a California Registered Civil Engineer.
- Diversion or isolation activities should not completely dam stream flow.
- Dewatering and removal may require additional sediment control or water treatment.

When

Clear water diversions should be implemented when:

- Isolating construction or operations and maintenance activities is necessary within or near a water body to protect the water body from the activity. Applicable activities may include but are not limited to: stream bank stabilization, culvert, bridge, pier, or abutment installation. They may also be used in combination with other methods, such as clear water bypasses and/or pumps.

Where

- A clear water diversion is typically implemented where appropriate permits have been secured and work must be performed in a flowing stream or water body.
- Pumped diversions are suitable for intermittent and low flow streams.
- Excavation of a temporary bypass channel, or passing the flow through a flume with a trench excavated under it, is appropriate for the diversion of streams less than 20 feet wide, with flow rates less than 100 cubic feet per second.
- Clear water diversions incorporating clean washed gravel may be appropriate for use in fish spawning streams.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How

In general:

- Where working areas encroach on flowing streams, barriers adequate to prevent the flow of muddy water into streams should be constructed and maintained. During construction of the barriers, stream muddying should be minimized.
- Diversion structures must be adequately designed to accommodate fluctuations in water depth or flow volume due to tides, storms, floods, etc.
- Equipment driven in a water body should be clean of petroleum residue, and water levels should be below the fuel tanks, gearboxes, and axles, unless lubricants and fuels are sealed such that water inundation will not result in pollutant discharges.
- Only excavation equipment buckets may reach out into the water body to remove or place fill. The main equipment body should not enter the water except as necessary to cross the stream to access the work site.
- Stationary equipment, such as motors or pumps located within or adjacent to a water body, should be positioned over drip pans.
- When any artificial obstruction is being constructed or maintained, sufficient water should at all times pass downstream to maintain aquatic life.
- Equipment should not park below high water marks unless allowed by permit.
- Disturbance or removal of vegetation should be minimized. Disturbed vegetation should be replaced with appropriate erosion control measures.
- Riparian vegetation, when removed pursuant to the work provisions, should be cut off no lower than the ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation should be covered by a sufficient layer of clean river run cobble to prevent damage to the underlying soil and root structure. The cobble must be removed upon completion of project activities.
- Drip pans should be placed under all vehicles and equipment placed structures over water bodies when the equipment is planned to be idle for more than one hour.
- Where possible, minimize diversion and encroachment impacts by scheduling construction during periods of low flow. Scheduling should also consider seasonal releases of water from dams, fish migration, and spawning seasons, and water demands due to irrigation.
- Construct diversion structures with materials free of potential pollutants such as soil, grease, or oil.

Several types of clear water diversions are detailed in the CASQA Handbook, each with different applications, design considerations, limitations, and inspection and maintenance requirements. These types of diversions include:

- Temporary Diversions and Encroachments
- Temporary Dry Construction Areas

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont')

- Filter Fabric Isolation
- Turbidity Curtain Isolation
- K-Rail River Isolation
- Stream Diversions

The CASQA Handbook should be consulted for additional information for these clear water diversions.

Maintenance and Inspection

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect weekly during the rainy season and at two week intervals in the non-rainy season to verify continued BMP implementation (e.g., or in compliance with the frequency specified in the CGP, if applicable).

Section 4 – Soil Erosion Control

What is Erosion?

Erosion is the detachment of soil particles by water or wind. Erosion is a natural process that can be accelerated by construction activities such as grading and trenching. For example, when a site is cleared and grubbed, protective vegetation is removed and the disturbed soil is directly exposed to wind, rain, and flowing water.

Why is Erosion Control Required?

Water or wind can transport soil particles to water bodies where they can cause damage to, or destruction of, aquatic animals and plants by burying them or reducing oxygen and/or sunlight that is necessary for their survival. Erosion control is required by regulatory agencies to minimize the potential additional erosion and damage to the environment from construction activities.

What is Erosion Control?

Erosion Controls are methods used to protect the soil surface and prevent the soil particles from being detached and transported by rain, flowing water or wind. Erosion controls include limiting soil or vegetation disturbance to reduce erosion. Preservation of Existing Vegetation is an example of an Erosion Control BMP.

Soil Stabilization is the most widely used and most effective method of erosion control. Preventing or reducing erosion potential by directing or controlling drainage runoff, as well as preparing and stabilizing disturbed soil areas protects the exposed soil surface from rain and wind thereby preventing erosion. Diversion Berms and Drainage Swales is an example of an erosion control BMP that intercepts and conveys run-on around or through the project reducing erosion potential. Hydroseeding is also an example of an erosion control BMP that stabilizes the soil. Erosion control BMPs used in this Manual to direct or control runoff and/or stabilize soil include:

- BMP 4-01 Preservation of Existing Vegetation
- BMP 4-02 Temporary Soil Stabilization (General)
- BMP 4-03 Hydraulic Mulch
- BMP 4-04 Hydroseeding
- BMP 4-05 Soil Binders
- BMP 4-06 Straw Mulch
- BMP 4-07 Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats
- BMP 4-08 Dust (Wind Erosion) Control
- BMP 4-09 Diversion Berms and Drainage Swales
- BMP 4-10 Velocity Dissipation Devices
- BMP 4-11 Slope Drains
- BMP 4-12 Streambank Stabilization
- BMP 4-13 Soil Preparation

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

Preservation of Existing Vegetation is a procedural BMP that maximizes the preservation of existing trees, shrubs, bushes, and grasses on a construction or operations and maintenance activity site.

When

This BMP is applicable to utility activities when there is existing vegetation.

Where

All construction and operations and maintenance activity sites where:

- There are areas on site where no activity is planned or will occur later.
- There are areas with vegetation that can be preserved to protect against soil erosion, such as on steep slopes, watercourses, and building sites in wooded areas.
- There are areas designated as ESAs, or where federal, state, or local government regulations require preservation, such as wetlands, vernal pools, marshes, etc.

How

Use the following measures as applicable:

- Preserve existing vegetation whenever possible.
- Identify areas to be preserved in the immediate vicinity of the construction or activity site, and mark as appropriate before clearing and grubbing or other soil disturbance activities.
- If necessary, contact the project Field Environmental Representative for any clarification regarding areas to be preserved.
- Whenever possible, minimize disturbed areas by locating temporary roadways to avoid stands of trees and shrubs and follow existing contours to reduce cutting and filling.
- Construction materials, equipment storage and parking areas should be located outside the drip line of any tree to be retained.
- Consider the impact of grade changes to existing vegetation and the root zone.
- Remove any markings, barriers, or fencing after project is completed.

Maintenance and Inspection

- Maintain the clearly marked limits of disturbance during construction to preserve vegetation.
- Inspect barriers regularly during construction.

Pictures

Vegetation to be preserved is marked and outside the work area.

Corresponding CASQA Fact Sheet

Fact Sheet EC-2

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

Temporary Soil Stabilization is a procedural BMP utilizing protective materials to cover exposed soil, where the soil exposure is caused by construction or operation and maintenance activities. Materials may include hydraulic mulch and seeding, soil binders, straw, geotextiles, plastic covers and erosion control blankets.

Temporary soil stabilization BMPs and their associated materials include:

- BMP 4-03 - Hydraulic Mulch
- BMP 4-04 - Hydroseeding
- BMP 4-05 - Soil Binders
- BMP 4-06 - Straw Mulch
- BMP 4-07 - Geotextiles, Plastic Covers and Erosion Control Blankets/Mats

When

This BMP, and the situation appropriate BMPs listed above, is applicable when slopes are constructed or disturbed and/or where there are inactive soil disturbance areas that will not be worked for 14 days or more. The procedures are to be implemented after slope construction activity is complete and then prior to the onset of precipitation.

Where

- Slopes, soil stockpiles, and inactive disturbed soil areas.
- Soil binders (BMP 4-05) may be applicable to areas where there is light traffic that would minimize the effectiveness of other temporary soil stabilization BMPs.

How

- Sediment control BMPs used to break up the slope lengths, such as fiber rolls (BMP 1-03) or gravel bag berms (BMP 1-04) should be spaced in accordance with the CGP requirements (see installation for BMP 1-03 “Fiber Rolls”)
- Permanent erosion control shall be applied to areas deemed substantially complete during the project’s defined seeding season window.
- Refer to individual temporary soil stabilization BMPs for specific instructions for use (see BMP 4-03 through BMP 4-07).

Maintenance and Inspection

- Refer to individual temporary soil stabilization BMPs listed above for maintenance and inspection requirements.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Pictures

Applying a tackifier using a trailer mounted pump and hose.

Applying soil stabilization manually in harder to reach areas.

Corresponding CASQA Fact Sheet

Fact Sheet EC-2

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

Hydraulic Mulch is a procedural BMP for applying mulch to protect the soil surface from wind and rain erosion.

Mulch consists of a mixture of shredded wood fiber or other fiber in water and a stabilizing emulsion, or tackifier. The mulch is applied with hydro-mulching equipment (water mixture spraying equipment).

When

Hydraulic mulch is typically applied when a temporary soil cover is required for protection until permanent vegetation is established, or to disturbed areas that must be re-disturbed following a period of inactivity of 14 or more days.

Where

- To disturbed areas requiring temporary protection.
- Do not apply to active work areas where the mulch would interfere with or be destroyed by immediate earthwork activities or construction traffic. Consider using soil binders instead (BMP 4-05).

How

- Prior to application, roughen embankment and fill areas with a crimping or punching type roller or by track walking. Track walking shall only be used where other methods are impractical and slope angle allows safe equipment operation. Track walking must be performed upslope so that equipment tracks traverse the slope horizontally along the slope.
- Avoid mulch over-spray onto the traveled way, sidewalks, lined drainage channels, and existing vegetation.
- Avoid use of mulch without a tackifier component, especially on slopes.
- Hydraulic Mulches:
    - Apply as liquid slurry using a hydraulic application machine (i.e., hydroseeder) at rates of mulch and stabilizing emulsion recommended by the manufacturer. Wood fiber hydraulic mulches are generally short-lived (only last a part of a growing season) and must be applied no less than 24 hours before rain events to dry and become effective.
        - Hydraulic Mulch with Binder (Matrix):
    - Apply a combination of wood fiber and/or paper fiber mixed with acrylic polymers as binders. Apply the mulch matrix as liquid slurry using a hydraulic application machine (i.e., hydroseeder) at rates recommended by the manufacturer. Hydraulic matrices must be applied no less than 24 hours before a rain event to dry and become effective.
        - Bonded Fiber Matrix (BFM):
    - Apply BFM using a hydraulic application machine (mulch and tackifier are pre-mixed in a single bag) in accordance with manufacturer's instructions. Do not apply immediately before, during, or after a rain event.
    - Note that cellulose fiber mulches alone may not perform well on steep slopes or in coarse soils.

Maintenance and Inspection

- Maintain an unbroken, temporary mulched ground cover throughout the period of construction when the soils are not being reworked. Inspect before expected rain and repair any damaged ground cover and re-mulch areas of exposed soil (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable).
- After any rain event, maintain all slopes to prevent erosion.

What

Hydroseeding is a procedural BMP for the application of vegetation seed in a protective mixture for both soil and seed. The seed then sprouts, providing vegetation that provides additional soil erosion control (holds the soil in place and shields the soil from erosion). Hydroseeding material typically consists of a mixture of fiber, seed, fertilizer, and stabilizing emulsion.

When

- When temporary protection is needed until permanent vegetation protection can be established. Temporary vegetation should not be used for more than 3 to 6 months.
- Avoid using hydroseeding during dry weather periods, unless supplemental irrigation is used.

Where

- Use on disturbed soil areas that must be re-disturbed following construction inactivity of 14 or more days.
- Avoid use of hydroseeding in areas where the BMP would be incompatible with site conditions. These conditions include:
  - Slopes steeper than 1:3 vertical: horizontal. Steep slopes are difficult to protect with temporary seeding.
  - Traffic areas, where construction or other traffic would prevent seed sprouting or vegetation growth. Consider using soil binders instead (see BMP 4-05).

How

- Hydroseeding can be accomplished using a multiple-step (with straw mulch) or a one-step process (mixed with hydraulic mulch, hydraulic matrix, or bonded fiber matrix). When the one-step process is used to apply the mixture of fiber, seed, etc., the seed rate shall be increased to compensate for all seed not having direct contact with the soil. Confirm with your project Field Environmental Representative the appropriate seed mix to be used.
- Prior to application roughen the slope, fill area, or area to be seeded with the furrows trending along the contours.
- Apply straw mulch as necessary to keep seeds in place and to moderate soil moisture and temperature until the seeds germinate and grow.
- Follow-up applications shall be made as needed to cover weak spots, and to maintain adequate soil protection.
- Avoid over-spray onto the travel way, sidewalks, drainage channels and existing vegetation.

Maintenance and Inspection

- All seeded areas shall be inspected for failures and re-seeded, fertilized, and mulched within the planting season, using not less than half the original application rates. Any temporary re-vegetation effort that does not provide adequate cover must be re-vegetated.
- After any rainfall event, maintain all slopes to prevent erosion.

What

Soil Binders is a procedural BMP for applying soil binder material to the soil surface to temporarily prevent water-induced erosion of exposed soils on construction or applicable operations and maintenance sites. Soil binders bind with the soil, creating a crust that sheds water and prevents the water erosion. Soil binders also provide temporary dust, wind, and soil stabilization benefits.

When

Soil binders are typically applied to disturbed soil areas that require short-term temporary protection.

Soil binders have the following application timing limitations:

- May not cure when low temperatures occur within 24 hours of application.
- Soil binders generally experience spot failures during heavy rain and may need reapplication after a storm.
- Some soil binders may not perform well during periods of low relative humidity.

Where

Soil binders can be used for any disturbed soil area. Soil binders can often be incorporated into the work so they may be a good choice for areas where grading activities will soon resume or that experience light construction traffic.

Soil binders have the following limitations for particular areas of application:

- Soil binders may not penetrate areas where soil surfaces are made up primarily of silt and clay, particularly when compacted.
- Soil binders may not hold up well in areas of heavy pedestrian or medium to heavy vehicular traffic.

How

Selection of soil binders should be approved by the project Field Environmental Representative after an evaluation of site-specific factors. Chemical soil binders must be on the SDG&E List of Approved Products. These approved soil binder products have low or no toxicity to aquatic organisms and wildlife and may not trigger the construction site sampling requirements of the CGP. Follow manufacturer's recommendations for application procedures and cleaning of equipment after use. Any onsite cleaning must use appropriate BMPs (BMP 2-02 "Material Use", 2-03 "Spill Control", 2-04 "Solid Waste Management", 2-08 "Liquid Waste/Drilling Fluid Management", and 3-03 "Vehicle and Equipment Washing").

- Prior to application, roughen embankment and fill areas. Track walking shall only be used where rolling is impractical.
- Soil binders should not be applied during or immediately before rain events. Soil binders must be applied no less than 24 hours before rain to cure and dry and become fully effective.
- Avoid over-spray onto paths, sidewalks, lined drainage channels, sound walls, and existing vegetation.

- **Do not apply soil binders to frozen soil, areas with standing water, under freezing conditions, or when the temperature is below 40ºF during the curing period.**
- More than one treatment is often necessary, although the second treatment may be diluted or have a lower application rate.
- For liquid agents:
  - Crown or slope ground to avoid ponding.
  - Uniformly pre-wet ground according to manufacturer's recommendations.
  - Apply solution under pressure. Overlap solution 6 to 12 inches.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont')

- Allow treated area to cure for the time recommended by the manufacturer; typically at least 24 hours.
- Apply second treatment before first treatment becomes ineffective, using 50 percent application rate.
- In low humidity, reactivate chemicals by re-wetting according to manufacturer's recommendations.

Maintenance and Inspection

- Reapplying the selected soil binder may be needed for proper maintenance. Traffic areas should be inspected routinely.
- After any rainfall event, maintain all slopes to prevent erosion.

What

Straw Mulch is a procedural BMP for the application of a uniform layer of straw to exposed soil surfaces to protect exposed soil from rain and wind erosion. Straw mulch consists of straw, and may incorporate a tackifier emulsion for stabilization of the mulch when used for protecting sloped areas of exposed soil.

When

Straw mulch is used when:

- Temporary soil stabilization surface cover is needed on disturbed areas until soils can be prepared for re-vegetation and permanent vegetation is established.
- In combination with temporary and/or permanent seeding strategies to enhance plant establishment. Straw mulch typically lasts less than six months.

Limitation: There is a potential for introduction of weed-seed and unwanted plant material with straw. Certified Weed free rice straw must be used when it is important not to introduce unwanted plants.

Where

Application of straw mulch is applicable to flat areas of exposed soil and areas of exposed soil with gradual slopes.

How

Use tackifier to anchor straw mulch to the soil on slopes. Tackifiers act to glue the straw fibers together and to the soil surface, and the tackifier shall be selected based on longevity and ability to hold the fibers in place. Soil binders (tackifier) will generally experience spot failures during heavy rain events. A tackifier is typically applied at a rate of 125 pounds per acre. In windy conditions, the rates are typically 150 pounds per acre.

- Crimping, punch roller-type rollers, or track-walking may also be used to incorporate straw mulch into the soil on slopes. Track walking shall only be used where other methods are impractical.
- Avoid placing straw onto construction traffic ways, sidewalks, lined drainage channels, and existing vegetation.
- Straw mulch with tackifier shall not be applied during or immediately before rain events.
- Apply loose straw at a rate between 3,000 and 4,000 pounds per acre (lb/acre), either by machine using a straw blower or by hand distribution and provide 100 percent ground cover. Use a lighter application on flat surfaces and a heavier application on slopes.
- The straw mulch must be evenly distributed on the soil surface.
- Anchor mulch in place by "punching" it into the soil mechanically in lieu of using a tackifier. "Punching" of straw does not work in sandy soils.
- Methods for holding the straw mulch in place depend on the slope steepness, accessibility, soil conditions and longevity. If the selected method is incorporation of straw mulch into the soil, then proceed as follows:
    - A tackifier acts to glue the straw fibers together and to the soil surface. Selection of a tackifier should be based on longevity and ability to hold the fibers in place. Application of a tackifier is typically at a rate of 125 lb/acre and 180 lb/acre in windy conditions.
    - On very small areas, a spade or shovel can be used.
    - On soil slopes which are stable enough, and gradually sloped to safely support construction equipment without contributing to compaction and instability problems, straw can be "punched" into the ground using a knife-blade roller or a straight bladed coulter, known commercially as a "crimper."

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont')

- On small areas and/or steep slopes, straw can also be held in place using plastic netting or jute. The netting shall be held in place using 11 gauge wire staples, geotextile pins or wooden stakes (BMP 4-07), "
- On small areas and/or steep slopes, straw can also be held in place using plastic netting or jute. The netting shall be held in place using 11 gauge wire staples, geotextile pins or wooden stakes (BMP 4-07, "Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats").

- Remove straw as necessary prior to permanent seeding or soil stabilization.

Maintenance and Inspection

- The key consideration in maintenance and inspection is that the straw needs to last long enough to achieve erosion control objectives.
- Reapplication of straw mulch and tackifier may be required to maintain effective soil stabilization over disturbed areas and slopes.
- After any rain event, inspect and maintain all slopes and straw mulch cover to prevent erosion.

Pictures

Straw mulch.

What

This Erosion Control and Soil Stabilization BMP is a procedural BMP for the installation of specific erosion control soil stabilization materials to control erosion from wind and water. These materials consist of:

- Geotextile blankets/mats,
- Plastic covers, and
- Natural/man-made material erosion control blankets.

Geotextiles are permeable fabrics typically made from polypropylene (plastic) or polyester that have the ability to protect the soil from erosion but are able to allow some water to reach and to drain the soil. Geotextile fabrics come in three basic forms: woven, needle punched, or heat bonded. Geotextiles also allow controlled rate and filtered drainage from a slope for slope moisture control, while providing slope reinforcement and protection.

Plastic Covers, such as Visqueen, are essentially impermeable and are used for immediate, temporary protection.

Erosion control blankets/mats are meant to protect exposed soil from wind and rain impact and reduce the speed at which water moves across the soil surface. These blankets can be made out of straw, coconut fiber, aspen fiber, jute, and polypropylene. Permeability varies according to material and material weave.

When

- Use blankets/mats when disturbed soils, especially on moderate to steep slopes, are difficult to stabilize or access. Due to wildlife concerns, consult with your project Field Environmental Representative for any restrictions on using these products on your project.
- Geotextile blanket/mats should be used when slope reinforcement may be required.
- Geotextile blankets/mats and natural fiber blankets/mats (depending on their permeability) are used when it is important to allow some water to reach the soil for seed germination or allow slope drainage for moisture control.

Where

- Blankets and mats are generally not suitable for excessively rocky sites or areas where the final vegetation will be mowed (because staples and netting can catch in mowers).
- Plastic results in 100 percent runoff, therefore, their use is limited to:
  - Covering small stockpiles.
  - Covering small graded areas for short periods, such as through an imminent storm event, until alternative measures may be installed.
  - Note the CGP discourages the use of plastic materials for cover when more sustainable alternatives can be used.

Blankets/mats should be used where there are:

- Steep slopes, generally steeper than 1:3 (vertical: horizontal).
- Slopes where the erosion hazard is high.
- Slopes and disturbed soils where mulches would need to be anchored.
- Disturbed areas where plants are slow to develop adequate protective cover.
- Channels with high flows.
- Channels intended to be vegetated.
- Slopes adjacent to water bodies or ESAs).

How

For blankets or mat materials, proper site preparation is essential to ensure complete contact of the blanket or matting with the soil.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Grade and shape the area of installation.
- Remove all rocks, clods, vegetation or other obstructions so that the installed blankets or mats will have complete, direct contact with the soil.
- Prepare seedbed by loosening of topsoil.
- Seed the area before blanket installation for erosion control and vegetation. Seeding after mat installation is often specified for turf reinforcement. When seeding prior to blanket installation, all check slots and other areas disturbed during installation must be re-seeded. Where soil filling is specified, seed the matting and the entire disturbed area after installation and prior to filling the mat with soil.
- U-shaped wire staples, metal geotextile stake pins, or triangular wooden stakes can be used to anchor mats and blankets to the ground surface.
- Wire staples and metal stakes should be driven flush to the soil surface.
- All anchors should be 6 inches to 18 inches long and have sufficient ground penetration to resist pullout. Longer anchors may be required for loose soils.
- Installation on slopes – Consult the manufacturer's recommendations for installation. In general, these will be as follows:
  - Begin at the top of the slope and anchor the blanket in a 6 inch deep by 6 inch wide trench. Backfill trench and tamp earth firmly.
  - Unroll blanket down slope in the direction of water flow.
  - Overlap the edges of adjacent parallel rolls 2 inches to 3 inches and staple every 3 feet.
  - When blankets must be spliced, place blankets end over end (shingle style) with a 6 inch overlap. Staple through overlapped area, approximately 12 inches apart.
  - Lay blankets loosely and maintain direct contact with the soil. Do not stretch.
  - Staple blankets sufficiently to anchor blanket and maintain contact with the soil. Staples shall be placed down the center and staggered with the staples placed along the edges.
- Blankets and mats must be removed and disposed of prior to application of permanent soil stabilization measures.
- For plastic sheeting, it is important for the entire stockpile or exposed soil area to be covered completely, and the plastic firmly anchored with anchor objects spaced evenly along the entire perimeter so that wind, or storm water run-on, does not uncover the stockpile. Suitable anchors are gravel bags, sand bags, hay bales, or other non-polluting objects that can be safely handled.

Maintenance and Inspection

- Areas covered with temporary soil stabilization should be inspected routinely and before and after significant forecasted storm events. Any failures should be repaired immediately. Areas covered with temporary soil stabilization should be maintained to provide adequate erosion control. Temporary soil stabilization should be reapplied or replaced on exposed soils when greater than 10 percent of the previously covered area becomes exposed or exhibits visible erosion.
- If washout or breakage occurs, re-install the material after repairing the damage to the slope or channel.

What

Dust (Wind Erosion) control is a procedural BMP that consists of applying water or other dust suppressant to prevent or alleviate dust nuisance generated by construction and operations and maintenance activities.

When

- Dust control must be used whenever wind speed picks up dust and creates visual dust emissions. Dust control should be used at least initially on any project when exposed soil is subject to vehicle traffic and soil disturbance activities (e.g., dirt construction site, dirt access road traffic, grading, excavating, and soil stockpile generation, or soil removal from soil stockpiles).
- Dust control must be implemented in accordance with local air quality requirements.

Where

All construction and operations and maintenance activity sites where exposed soil is susceptible to wind erosion.

How

Use the following measures as applicable:

- Appropriate methods of applying dust control (water, chemical dust suppressant, or soil covers and the means to apply it) should be available for construction or operation and maintenance activity sites with the potential to create dust.
- Water applied for dust control should be applied evenly and in a manner that does not generate runoff.
- Dust control methods should be approved by the project Field Environmental Representative. A construction permit or an agency rule may require specific control procedures.
- Obtain prior approval to use any chemical dust suppressant from the project Field Environmental Representative. Dust suppressant chemicals must be on SDG&E's approved product list
- Non-potable water should not be conveyed in tanks or drainpipes that will be used to convey potable water, and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes and other conveyances should be marked **"NON-POTABLE WATER – DO NOT DRINK."** Approval for use of all non-potable sources of water must be obtained from the project Field Environmental Representative.

- If reclaimed wastewater is used for dust control, the sources and discharge must meet California Department of Health Services water reclamation criteria and RWQCB requirements. Approval for use of reclaimed wastewater must be obtained from the project Field Environmental Representative.

Maintenance and Inspection

- Check areas protected to ensure coverage.
- Reapply water, chemical dust suppressants, or maintain soil covers as necessary to maintain their effectiveness.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

A diversion berm is a temporary berm of compacted soil used to direct runoff water to a desired location. A drainage swale is a shaped and sloped soil depression used to convey runoff to a desired location. Diversion berms and drainage swales divert off site runoff around the construction or operation and maintenance site, divert runoff from flowing onto stabilized areas and disturbed areas, and direct runoff into sediment basins or traps. A diversion berm or swale itself does not control erosion or remove or trap sediment from runoff.

Limitations:

- Diversion berms may create disturbed areas and become construction equipment barriers.
- Diversion berms must be stabilized immediately, adding cost and maintenance.
- Diverted storm water may cause downstream flood damage.
- Berms should not be constructed of easily eroded soils.
- Regrading the site to remove the berm may add cost.
- Other soil stabilization and sediment controls such as check dams, plastics, and blankets may be needed to prevent erosion in newly graded berms and swales.
- Sediment accumulation, scour depression, and/or persistent non-storm water discharges can result in standing water suitable for mosquito production.

When

Diversion berms and drainage swales are suitable for use, individually or together, where runoff needs to be diverted from one area to another. These BMPs may be used:

- To direct runoff away from disturbed areas or at the top of slopes.
- To convey surface runoff down sloping land.
- To divert runoff towards a stabilized watercourse, drainage pipe, or channel.
- To intercept runoff from paved surfaces.
- To divert sediment laden runoff into sediment basins or traps.

Where

Diversion berms and drainage swales should be considered:

- At the top of slopes to divert run-on from adjacent or undisturbed slopes.
- At bottom and mid-slopes to intercept sheet flow and convey concentrated flows.
- Below steep grades where runoff begins to concentrate.
- Along roadways and facility improvements subject to flood drainage.
- Berms should not be used for drainage areas greater than 10 acres or along slopes greater than 10 percent. For larger drainage areas, more permanent drainage structures should be built in accordance with local requirements.
- Drainage areas more than 5 acres should not drain to a temporary drainage swale. For larger drainage areas, use berms, or more permanent drainage structures should be built in accordance with local requirements.

How

Berms and swales should not adversely affect adjacent properties and must conform to local floodplain management regulations. Obtain written

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

authorization from property owner to divert runoff onto another property.

- Care must be applied to correctly size and locate berms and drainage swales.
- Conveyances and outlets should be stabilized.
- Size to control flow velocity based on evaluation of the erosion risk, soil types, overtopping, flow backups, washout, and site drainage flow patterns.
- Install permanent berms and swales early in the construction process.

Diversion Berms:

- Compact all berms and provide positive drainage to an outlet.
- All berms should have 1:2 (vertical: horizontal) or flatter side slopes, and minimum 18-inch height, and minimum 24-inch top width. Wide top widths and flat slopes are usually needed for construction traffic crossings.
- Runoff should be conveyed to a sediment trapping device when the berm channel or the drainage area above the berm are not adequately stabilized.
- Temporary stabilization may be achieved using seed and mulching for slopes less than 5 percent and either riprap or sod for slopes greater than 5 percent. Stabilization should be completed immediately after installation/placement.
- If riprap is used to stabilize the channel formed along the toe of the berm, the following typical specifications apply:

Channel Grade	Riprap Stabilization
0.5 - 1%	4 inch Rock
1.1 - 2.0%	6 inch Rock
2.1 - 4.0%	8 inch Rock
4.1 - 5.0%	8 to 12 inch Riprap

- The riprap, recycled concrete, etc. should be pressed into the soil with construction equipment.
- Filter fabric may be used to cover berms in use for long periods.
- Construction activity on the earthen berms should be kept to a minimum.

Drainage Swales:

Standard engineering design criteria for small open channel and closed conveyance systems should be used. Unless local drainage design criteria state otherwise, drainage swales should be designed as follows:

- Place drainage swales above or below, not on, a cut or fill slope.
- Swale bottom width should be at least 2 feet, and the depth of the swale should be at least 18 inches. The swale side slopes should be 1:2 (vertical: horizontal) or flatter.
- Drainage swales should be at a grade of at least 1 percent, but not more than 15 percent.
- The swale must not be overtopped by the peak discharge from a 10-year storm, irrespective of the design criteria above.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Remove all vegetation and other objectionable materials and compact the fill material along the swale path.
- Stabilize all swales immediately after installation/placement. Seed and mulch swales with slopes of less than 5 percent and use riprap or sod for swales with slopes between 5 and 15 percent. For temporary swales, geotextiles and mats may provide immediate stabilization.
- Irrigation may be required to establish sufficient vegetation to prevent erosion.
- Do not operate vehicles across a swale unless a stabilized crossing is provided.
- Permanent drainage facilities must be designed by a California Registered Civil Engineer.
- At a minimum, the drainage swale should conform to predevelopment drainage patterns and capacities.
- Construct the drainage swale with a positive grade to a stabilized outlet.
- Provide erosion protection or energy dissipation measures if the flow out of the drainage swale can reach erosive velocity.

Maintenance and Inspection

- Inspect berms and drainage swales dams prior to, daily during, and after each storm event, and routinely throughout the construction activity (e.g., weekly, or in compliance with the frequency specified in the CGP, if applicable).
- Inspect BMPs subject to non-storm water discharges daily while the discharges occur.
- Inspect ditches and berms for washouts and erosion. Repair riprap, damaged linings, or soil stabilizers, and linings as needed.
- Inspect channel linings, embankments, and beds of swales and berms for erosion and accumulation of debris and sediment. Remove accumulated debris and sediment as needed. Removed sediment shall be incorporated in the project at appropriate locations or disposed of in accordance with federal, state and local requirements.
- Temporary conveyances should be completely removed as soon as the surrounding drainage area has stabilized or at the completion of construction.

Corresponding CASQA Fact Sheet Fact Sheet EC-9

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

What

Velocity dissipation devices are composed of rock, riprap, grouted riprap or concrete rubble, placed at the outlet of a pipe, channel, or waterbar to prevent scour and erosion caused by concentrated high velocity flows. There are many types of dissipation devices.

Limitations:

- Large storms or high flows can wash away the outlet protection and leave the area susceptible to erosion.
- Sediment captured by the outlet protection may be difficult to remove without removing the protection.
- Outlet protection may negatively impact the channel habitat.
- Grouted riprap may break up in areas of freeze and thaw.
- With inadequate drainage, water may build up behind and break grouted riprap.
- Sediment accumulation, scour depression, and/or persistent non-storm water discharges can result in standing water suitable for mosquito production.

When

Velocity dissipation devices are suitable when discharge velocities and energies at the outlets of culverts, conduits, waterbars, or channels are sufficient to erode the next downstream reach.

Where

Velocity dissipation devices should be considered:

- At outlets of pipes, drains, culverts, slope drains, diversion ditches, swales, conduits, channels, waterbars, etc.
- At outlets located at the bottom of mild to steep slopes.
- At discharge outlets that carry continuous water flow.
- At outlets subject to short, intense water flows, such as flash floods.
- At points where lined conveyances discharge to unlined conveyances.

How

Depth of flow, roughness, gradient, side slopes, discharge rate, and velocity should be considered in the outlet design. Compliance to local and state regulations should be considered, particularly while working in environmentally sensitive streambeds.

- Determine the apron length and rock size gradation using the discharge pipe diameter and estimated discharge rate table below. Select the longest apron length and largest rock size suggested by the pipe size and discharge rate. Recommendations for rock size and length of outlet protection mat should be considered minimums. Use sound, durable, and angular rock.
- Where flows are conveyed in open channels such as ditches or swales, use the estimated discharge rate for selecting the apron length and rock size. Flows should be the same as the culvert or channel design flow but never less than the pear 5 year flow for temporary structures planned for one rainy season, or the 10 year peak flow for temporary structures planned for two or three rainy seasons.
- Install filter fabric, riprap, grouted riprap, or concrete apron at selected outlet. Install filter fabric or well-graded filter layer beneath the riprap apron. Riprap aprons are best suited for temporary use during construction. Grouted or wired riprap can minimize maintenance.
- Rock outlet protection is usually less expensive and easier to install than concrete aprons or energy dissipaters, and serves to trap sediment and reduce flow velocities.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Carefully place riprap to avoid damaging the underlying filter fabric.
  - Rock 4 to 6-inches may be carefully dumped onto the filter fabric from a maximum height of 12 inches.
  - 8- to 12-inch rock must be hand placed onto filter fabric, or the filter fabric may be covered with 4 inches of gravel, and the rock may be dumped from a maximum height of 16 inches.
  - Rock greater than 12 inches shall only be dumped onto filter fabric protected with a layer of gravel with a thickness equal to one-half the D_{50} rock size, with the dump height limited to twice the gravel protection layer thickness.
- Align apron with receiving stream and keep straight throughout its length. If a curve is needed to fit site conditions, place it in the upper section of the apron.
- Outlets on slopes steeper than 10 percent should have additional protection.

Pipe Diameter (in)	Discharge (ft^3/s)	Apron Length (ft)	Min. Riprap D_{50} Diameter (in)
12	5	10	4
	10	13	6
18	10	10	8
	20	16	12
	30	23	16
	40	26	8
24	30	16	8
	40	26	12
	50	26	16
	60	30	8

Maintenance and Inspection

- Inspect velocity dissipation devices prior to and after each rain event, and daily during extended rain events throughout the construction activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect BMPs subject to non-storm water discharges daily while the discharges occur. Minimize standing water by removing sediment blockages and filling depressions.
- Inspect apron for displacement of the riprap and damage to the underlying fabric. Repair fabric and replace riprap that has washed away. If riprap continues to wash away, consider using larger material.
- Inspect for scour beneath the riprap and around the outlet. Repair damage to slopes or underlying filter fabric immediately.
- Temporary devices should be completely removed as soon as the surrounding drainage area has been stabilized or at the completion of construction.

What

A slope drain is a pipe used to intercept and direct surface runoff or groundwater into a stabilized watercourse, trapping device, or stabilized area. Slope drains are typically used with diversion berms and drainage ditches to intercept and direct surface flow away from slope areas to protect cut or fill slopes. Slope drains prevent storm water from flowing directly down the slope by confining the runoff into an enclosed pipe or channel. The slope drain may be installed as a rigid pipe, such as corrugated metal, a flexible conduit, or a lined terrace drain with a top of a slope inlet and a bottom of a slope outlet.

Limitations:

- Slope drain sizing, installation, and maintenance is critical to minimize the potential for failure. Severe erosion may result when slope drains fail by overtopping, pipe separation, or other signs of erosion.
- Dissipation of high flow velocities at the pipe outlet is required to avoid erosion.
- Sediment accumulation, scour depression, and/or persistent non-storm water discharges can result in standing water suitable for mosquito production.

When

Slope drains are suitable when:

- Concentrated runoff flow must be conveyed down a slope.
- Drainage is needed for top of slope diversion dikes or swales.
- Drainage is needed for top of cut and fill slopes where water can accumulate.
- Emergency spillway is required for a sediment basin.

Where

Slope drains should be considered where:

- The drainage area is less than 10 acres per slope drain. For larger areas, use a rock-lined channel, or subdivide into areas of 10 acres or less, with each area is treated as a separate drainage.
- Drainage areas exceeding 10 acres must be designed by a California Registered Civil Engineer and approved by the agency that issued the grading permit.

How

- Permanent structures included in the project plans can often serve as construction BMPs if implemented early. However, the permanent structure must meet or exceed the criteria for the temporary structure.
- Slope drains and inlets must be securely attached to the slope and must be adequately sized to carry the capacity of the design storm and associated forces.
- Outlets must be stabilized with riprap, concrete, or other type of energy dissipater, or directed into a stable sediment trap or basin.
- Debris racks are recommended at the inlet. Debris racks are barriers used to collect debris that is too large to pass through the inlet. Debris racks located several feet upstream of the inlet can usually be larger than racks at the inlet, and thus provide enhanced debris protection and less plugging.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Safety racks are also recommended at the inlet and outlet of pipes to prevent a human body or animal from washing into the pipe and/or becoming trapped.
- Size to convey at least the peak flow of a 10-year storm. The design storm is conservative due to the potential impact of system failures. The pipe size may be computed using the Rational Method or a method established by a local municipality. Higher flows must be safely stored or routed to prevent any offsite concentration of flow or erosion.Maximum slope generally limited to 1:2 (vertical: horizontal) as energy dissipation below steeper slopes is difficult.
- Direct surface runoff to slope drains with interceptor dikes. Top of interceptor dikes should be 12 inches higher than the top of the slope drain.
- Slope drains can be placed on or buried beneath the slope surface.
- As a guide, temporary slope drains should not be sized smaller than shown in the following table:

Minimum Pipe Diameter (inches)	Maximum Drainage Area (Acres)
12	1.0
18	3.0
21	5.0
24	7.0
30	10.0

- Recommended materials include metal, plastic, or concrete pipe, either corrugated or smooth wall. The following types of slope drains are common:
  - Rigid Pipe: Also known as a pipe drop, the pipe usually consists of corrugated metal pipe or rigid plastic pipe. The pipe is placed on undisturbed or compacted soil and secured to the slope surface or buried in a trench. Concrete thrust blocks must be used when warranted by the calculated thrust forces. Collars should be properly installed and secured with straps or watertight collars.
  - Flexible Pipe: The pipe consists of a flexible tube of heavy duty plastic, rubber, or composite material. The tube material is securely anchored to the slope surface. The tube should be securely fastened to the metal inlet and outlet conduit sections with metal straps or watertight collars.
  - Section Downdrains: The section downdrain consists of a pre-fabricated, section conduit of half round or third round material, and performs similar to a flume or chute. The pipe must be placed on undisturbed or compacted soil and secured into the slope.
  - Concrete-Lined Terrace Drain: This concrete channel drains water from a slope terrace to the next level. These drains are typically specified as permanent structures and should be designed according to local criteria. If installed early, they can be construction slope drains.

How

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

(cont.)

When installing slope drains:

- Install perpendicular to slope contours.
- Compact soil around and under entrance, outlet, and along length of pipe.
- Securely anchor and stabilize pipe appurtenances into soil.
- Check to ensure that pipe connections are watertight.
- Protect areas around inlet with filter fabric. A flared end section installed at the inlet will improve flow into the slope drain and prevent erosion at the pipe entrance. Use a flared section with a 6-inch minimum toe plate to help prevent undercutting. The flared section should slope towards the pipe inlet.
- Protect outlet with riprap or other energy dissipation device. Protect outlet of slope drains using a flared end section when outlet discharges to a flexible energy dissipation device.

Maintenance and Inspection

- Inspect slope drains prior to and after each storm event, and daily during extended rain events throughout the construction activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect BMPs subject to non-storm water discharges daily while the discharges occur. Minimize standing water by removing sediment blockages and filling depressions.
- Inspect outlet for erosion and downstream scour. If eroded, repair damage and install additional energy dissipation measures. If downstream scour is occurring, it may be necessary to reduce flows being discharged into the channel unless other preventative measures are implemented.
- Insert inlet for clogging or undercutting. Remove debris from inlet to maintain flows. Repair undercutting at inlet, and if needed, install flared section or riprap around the inlet to prevent further undercutting.
- Inspect pipes for leakage. Repair leaks and restore damaged slopes.
- Inspect slope drainage for accumulations of debris and sediment. Remove sediment from entrances and outlets as required. Flush drains as necessary; capture and settle out sediment from discharge.
- Ensure water is not ponding onto inappropriate areas (e.g. active traffic lanes, material storage areas, etc.).
- Pipe anchors must be checked to ensure that the pipe remains anchored to the slope. Install additional anchors if pipe movement is detected.

What

Streambank stabilization includes measures to reduce the discharge of sediment from streambanks with exposed or disturbed soil, or unstable banks. Streambank stabilization measures include preservation of existing vegetation, hydraulic mulch, hydroseeding, soil binders, straw mulch, geotextiles and mats, berms, and drainage swales, velocity dissipation devices, and slope drains. Streambank sediment controls include silt fences, fiber rolls, gravel bag berms, rock filters, and K-rail barriers, and padding. Each of these measures have different applications, limitations, and maintenance requirements for use as streambank stabilization.

Stream channels, streambanks, and associated riparian areas are dynamic and sensitive ecosystems that respond to changes in land use. Streams on the 303(d) list and listed for sediment may require numerous measures to prevent any increases in sediment load to the stream.

General streambank stabilization limitations:

- **Specific permit requirements or mitigation measures such as RWQCB 401 Certification, U.S. Army Corps of Engineers 404 permit and approval by the California Department of Fish and Game supersede the guidance in this BMP.**
- If numerical water quality standards are mentioned in any of these and other related permits, testing and sampling may be required. Soil disturbance activities in watersheds having streams listed as 303(d) impaired for sediment, silt, or turbidity, may require sampling to verify that there is no net increase in sediment load.

When

When construction or operations and maintenance activities occur within stream channels and associated riparian areas.

Where

Streambank stabilization procedures apply to all construction projects and operations and maintenance activities that disturb or occur within stream channels and their associated riparian areas.

How

Planning should account for: scheduling; avoidance of wet in-stream construction; minimizing disturbance and construction time period; selecting crossing location; and selecting equipment.

- **Construction and operation and maintenance activities should be scheduled according to the relative sensitivity of the environmental concerns and will be different when working near perennial streams vs. ephemeral streams.**
- Minimize disturbance by using pre-disturbed areas, selecting the narrowest crossing location, limiting vehicle crossing trips, and minimizing the number and size of work areas. Plan work areas at least 50 feet from the stream channel.
- Avoid steep and unstable banks, highly erodible or saturated soils, or highly fractured rock.
- Select a project or work site that minimizes disturbance to aquatic species or habitat.
- Select equipment that reduces the amount of pressure exerted on the ground surface (less than 5 or 6 pounds per square inch where possible.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

Maintenance and Inspection

- Inspect streambank stabilization BMPS prior to and after each storm event, and daily during extended rain events throughout the construction activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Inspect BMPs subject to non-storm water discharges daily while the discharges occur.
- Inspect and repair equipment (for damaged hoses, fittings, and gaskets, etc.).

What

Soil preparation/roughening involves assessment and preparation of surface soils for BMP installation. This includes soil testing (for seed base, soil characteristics, or nutrients), or roughening surface soils by mechanical methods (including sheepsfoot rolling, track walking, scarifying, stair stepping, and imprinting) to prepare soils for additional BMPs or to break up sheet flow. Soil preparation can also involve tilling topsoil to prepare a seed bed and/or incorporation of soil amendments to enhance vegetative establishment. Various roughening techniques on slopes can result in a significant erosion reduction as compared to smooth slopes.

Limitations:

- Preparation and roughening must take place prior to installing other erosion controls (such as hydraulically applied stabilizers) or sediment controls (such as fiber rolls) on slope faces.
- In cases where slope preparation is minimal, erosion control/revegetation BMPs that do not require extensive soil preparation (such as hydraulic mulching and seeding applications) should be employed.
- Consideration should be given to the type of erosion control BMP that follows surface preparation, as some BMPs are not designed to be installed over various types of tillage/roughening.

When

- Soil preparation is most effective when used in combination with erosion controls. Soil preparation (i.e. tilling, raking, and amendment) is essential to proper vegetative establishment, and suitable in combination with any soil stabilization method, including rolled erosion control products (RECPs) or sod.
- Soil roughening is suitable for use as a complementary process to soil preparation for controlling erosion, and is not intended to be used as a stand-alone BMP. Soil roughening should be used with perimeter controls, additional erosion control measures, grade breaks, and vegetative establishment for maximum effectiveness. Soil roughening is referred to as track walking (sometimes called imprinting) a slope, where treads from heavy equipment run parallel to the slope contours and create terraces. Roughening is intended to only affect surface soils and should not compromise slope stability or overall compaction.

Where

Soil preparation should be considered:

- Where vegetation is desired.

Soil roughening should be considered:

- Along any disturbed slopes, including temporary stockpiles, sediment basins, or compacted soil diversion berms and swales.
- Roughening should be used in combination with hydraulically applied stabilization methods, compost blankets, or straw mulch; but should not be used in combination with RECPs or sod because roughening is intended to leave terraces on the slope.

How

Minimal materials are required unless amendments and/or seed are added to the soil. Most soil roughening/preparation can be done with standard construction equipment.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

Soil Preparation

- Where appropriate, soil should be prepared to receive the seed by disking or scarifying the surface to eliminate crust, improve air and water infiltration and create a more favorable environment for germination and growth.
- Based on soil testing, apply additional soil amendments (e.g. fertilizers, additional seed) to the soil to help with germination.

Cut Slope Roughening

- Stair-step grade or groove the cut slopes steeper than 1:3 (vertical: horizontal).
- Use stair-step grading on any erodible material soft enough to be ripped with a bulldozer. Slopes consisting of soft rock with some subsoil are well suited to stair-step grading.
- Make the vertical cut distance less than the horizontal distance, and slightly slope the horizontal position of the "step" in toward the vertical wall.
- Do not make individual vertical cuts more than 2 feet or 3 feet high in soft or rock materials, respectively.
- Groove the slope using machinery to create a series of ridges and depressions that run across the slope on the contour.

Fill Slope Roughening

- Place on fill slopes with inclinations steeper than 1:3 (vertical: horizontal) in lifts not to exceed 8 inches, and ensure that each lift is properly compacted.
- Ensure that the slope face consists of loose, uncompacted fill 4 to 6 inches deep.
- Use grooving or tracking to roughen the face of slopes, if necessary.
- Do not blade or scrape the final slope face.

Roughening for Slopes to be Mowed

- Slopes which require mowing should be flatter than 1:3 (vertical: horizontal).
- Roughen these areas to shallow grooves by track walking, scarifying, sheepsfoot rolling, or imprinting. Excessive roughness is undesirable when mowing is planned.
- Space grooves less than 10 inches apart, and not less than 1 inch deep, and perpendicular to the direction of runoff (parallel to the slope contours).

Roughening with Tracked Machinery

- Limit roughening with tracked machinery to soils with a sandy textural component to avoid undue compaction of the soil surface.
- Operate tracked machinery up and down the slope to leave horizontal depressions in the soil. Do not back-blade during the final grading operation.

Copyright © 2010 San Diego Gas & Electric. All rights reserved.

How (cont.)

- Seed and mulch roughened areas as soon as possible to obtain optimum seed germination and growth.

Maintenance and Inspection

- Inspect BMPs prior to and after each storm event, and daily during extended rain events throughout the construction activity (e.g., weekly, or in compliance with the frequency specified in the project specific SWPPP, if applicable). Initiate repairs related to a storm event within 72 hours of identifying the problem or as soon as possible but prior to the next predicted storm event, per the CGP.
- Check the seeded slopes for signs of erosion such as rills and gullies. Fill these areas slightly above original grade, then reseed and mulch as soon as possible.

4.9 HYDROLOGY AND WATER QUALITY

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements?			✓	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?			✓	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?			✓	
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?			✓	
e) Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?			✓	
f) Otherwise substantially degrade water quality?			✓	
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				✓

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
h) Place within a 100-year flood hazard area structures that would impede or redirect flood flows?				✓
i) Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?				✓
j) Cause inundation by seiche, tsunami, or mudflow?			✓	

4.9.0 Introduction

This section describes the existing surface and groundwater hydrology, use, and quality, as well as the potential for erosion and flooding in the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) area. It also describes the potential impacts from construction, operation, and maintenance of the Proposed Project to these resources. The Proposed Project will implement a Storm Water Pollution Prevention Plan (SWPPP) and Spill Prevention, Control, and Countermeasure (SPCC) Plan, which are both required by law. The Proposed Project will also follow SDG&E's Water Quality Construction Best Management Practices (BMP) Manual. As a result, the Proposed Project will result in a less-than-significant impact to hydrology and water quality.

4.9.1 Methodology

Hydrology and water quality in the Proposed Project area were evaluated through a reconnaissance-level survey and review of the following:

- water quality studies and Environmental Impact Reports from other projects in the area,
- city and county general plans,
- United States (U.S.) Geological Survey 7.5-minute series quadrangle maps,
- online geographic information system sources, and
- aerial photographs of the Proposed Project area.

The San Diego Regional Water Quality Control Board's (RWQCB) Water Quality Control Plan for the San Diego Basin (Basin Plan) was reviewed to ensure compliance with state and local regulations. Federal Emergency Management Agency (FEMA) maps were referenced to determine the location and extent of flood zones.

4.9.2 Existing Conditions

The regulatory requirements and overall existing hydrologic conditions of the Proposed Project are described in the following subsections.

Regulatory Background

Federal

Clean Water Act

The Clean Water Act (CWA) (Title 33 of the U.S. Code [U.S.C.] Section 1251 et seq.), formerly the Federal Water Pollution Control Act of 1972, was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of waters of the U.S. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and certain non-point source discharges to surface water.

Clean Water Act Section 402

The National Pollutant Discharge Elimination System (NPDES) program was established in 1972 to control discharges of pollutants from defined point sources (33 U.S.C. § 1342). The program originally focused on industrial-process wastewater and publically owned treatment works. In 1987, Section 402 of the CWA was amended to include requirements for five separate categories of storm water discharges, known as Phase I facilities. Phase I facilities include the following:

- facilities already covered by an NPDES permit for storm water,
- facilities that engage in industrial activities,
- large municipal separate storm drain systems that serve more than 250,000 people,
- medium municipal separate storm drain systems that serve between 100,000 and 250,000 people, and
- facilities that are considered significant contributors of pollutants to waters of the U.S.

The U.S. Environmental Protection Agency (EPA) issued a final rule for Phase II discharges in August 1995. Phase II storm water discharges include light industrial facilities, small construction sites (i.e., less than five acres), and small municipalities (i.e., populations of less than 100,000 people).

In California, NPDES permitting authority is delegated to, and administered by, the nine RWQCBs. On August 19, 1999, the State Water Resources Control Board (SWRCB) reissued General Permit for Stormwater Discharges Associated with Construction Activity (Water Quality Order 99-08-DWQ) and, later that year, amended the permit to apply to sites as small as one acre.

On September 2, 2009, the SWRCB adopted Order No. 2009-0009-DWQ (Construction General Permit), which reissued Water Quality Order 99-08-DWQ for projects disturbing one or more acres of land, or that are part of a common plan of development or sale that disturbs more than one acre of land where the rainfall erosivity waiver does not apply. The new permit became

effective July 1, 2010, whereby all existing dischargers and new dischargers are required to obtain coverage under the new permit by submitting Permit Registration Documents.

The Construction General Permit requires the implementation of a SWPPP, which must be prepared before construction begins and kept on site throughout the construction process. In accordance with the Order No. 2009-0009-DWQ, the SWPPP must include:

- identification of pollutant sources and non-storm water discharges associated with construction activity;
- specifications for BMPs that will be implemented during project construction to minimize the potential for accidental releases and runoff from the construction areas, including temporary construction yards, pull sites, and other temporary work areas;
- calculations and design details, as well as BMP controls for site run-on;
- BMPs used to eliminate or reduce pollutants after construction is complete; and
- certification from a Qualified SWPPP Developer.

While the SWPPP lays out the groundwork for compliance with the Construction General Permit, it is also a repository for completed Rain Event Action Plans (REAPs). During construction, the REAP is a site-specific plan that is geared to address rain events for each specific phase of construction. The REAP was not previously required under Water Quality Order 99-08-DWQ.

Clean Water Act Section 404

Section 404 of the CWA authorizes the U.S. Army Corps of Engineers (USACE) to regulate the discharge of dredged or fill material to waters of the U.S., including wetlands (33 U.S.C. § 1344). The USACE issues individual site-specific permits or general permits (i.e., Nationwide Permits or Regional General Permits) for such discharges.

Clean Water Act Section 401

Under Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity that may result in any discharge into navigable waters must provide the licensing or permitting agency with a Water Quality Certification that the discharge will comply with the applicable CWA provisions or a waiver (33 U.S.C. § 1341). If a federal permit is required, such as a USACE permit for dredge and fill discharges, the project proponent must also obtain a Water Quality Certification from the RWQCB.

Clean Water Act Sections 303 and 304

Section 303 of the CWA requires states to adopt water quality standards for all surface Waters of the U.S. (33 U.S.C. § 1313). Section 304(a) requires the U.S. EPA to publish water quality criteria that accurately reflect the latest scientific knowledge on the kind of effects and extent of effects that pollutants in water may have on health and welfare (33 U.S.C. § 1314(a)). Where multiple uses exist, water quality standards must protect the most sensitive use. Water quality

standards are typically numeric, although narrative criteria based on biomonitoring methods may be employed when numerical standards cannot be established or when they are needed to supplement numerical standards.

Section 303(c)(2)(b) of the CWA requires states to adopt numerical water quality standards for toxic pollutants for which the U.S. EPA has published water quality criteria and which could reasonably be expected to interfere with designated uses in a waterbody.

Under Section 303(d) of the CWA, states, territories, and authorized tribes are required to develop a list of waterbodies where beneficial uses are impaired. The waters on the list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. The law requires that these jurisdictions establish priority rankings for water segments on the lists and develop action plans, called Total Maximum Daily Loads, to improve water quality.

Rivers and Harbors Appropriation Act Section 10

Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 U.S.C. § 401 et seq.) makes it unlawful to obstruct or alter a navigable river or other navigable water of the U.S. Construction, excavation, or deposition of materials in, over, or under such waters, or any work that will affect the course, location, condition, or capacity of those waters, requires a Section 10 permit and approval from the USACE.

National Flood Insurance Program

FEMA is responsible for determining flood elevations and floodplain boundaries based on USACE studies. FEMA is also responsible for distributing the Flood Insurance Rate Maps used in the National Flood Insurance Program (NFIP). These maps identify the locations of special flood hazard areas, including the 100-year floodplain. FEMA allows non-residential development in floodplains; however, construction activities are restricted within flood hazard areas, depending on the potential for flooding within each area. Federal regulations governing development in a floodplain are set forth in Title 44, Part 60 of the Code of Federal Regulations, enabling FEMA to require municipalities that participate in the NFIP to adopt certain flood hazard reduction standards for construction and development in 100-year floodplains.

State and Local

California Fish and Game Code

Sections 1601 through 1606 of the California Fish and Game Code require a Lake or Streambed Alteration Agreement (LSAA) between the California Department of Fish and Wildlife and an entity proposing to substantially divert or obstruct the natural flow or affect changes to the bed, channel, or bank of any river, stream, or lake. The LSAA is designed to protect the fish and wildlife resources of a river, lake, or stream.

State Water Resources Control Board Order 2001-11-DWQ

The SWRCB adopted the Statewide General NPDES Permit for Discharges from Utility Vaults & Underground Structures to Surface Waters (General Permit CAG990002) in 2001. This

permit authorizes permittees to discharge uncontaminated water from vaults and substructures to surface waters during the operational phase of projects.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act of 1967, California Water Code Section 13000 et seq., requires the SWRCB and the nine RWQCBs to adopt water quality criteria to protect waters of the State. These criteria include the identification of beneficial uses, narrative and numerical water quality standards, and implementation procedures. The criteria for the Proposed Project area are contained in the San Diego RWQCB's Basin Plan.

San Diego Regional Water Quality Control Board Basin Plan

The San Diego RWQCB (Region 9) is responsible for protecting the beneficial uses of surface water and groundwater resources in the San Diego area. The RWQCB adopted the Basin Plan in September 1994. The plan sets forth implementation policies, goals, and water management practices in accordance with the Porter-Cologne Water Quality Control Act and establishes both numerical and narrative standards and objectives for water quality aimed at protecting aquatic resources. Discharges to surface waters within the approximately 3,900 square miles of the San Diego Basin are subject to the regulatory standards set forth in the Basin Plan, which prevents the unauthorized discharge of pollutants into waters of the U.S. and State. NPDES permits, waste discharge requirements, and waivers are mechanisms used by the RWQCB to control discharges and protect water quality.

San Diego Regional Water Quality Control Board Municipal Storm Water Permit

The San Diego RWQCB issued the San Diego Municipal Permit Order No. R9-2013-0001 (NPDES No. CAS0109266) to the County of San Diego, the San Diego Unified Port District, San Diego Regional Airport Authority, and 18 cities in San Diego County (Co-permittees) with the primary goal of preventing polluted discharges from entering the storm water conveyance system and local receiving and coastal waters. Pursuant to the permit, the Co-permittees are required to develop and implement measures that will address and prevent pollution from development projects. Priority development projects are also required to include BMPs in the permanent design to reduce pollutant discharges from project sites.

County of San Diego Standard Urban Stormwater Mitigation Plan

In order to comply with the San Diego RWQCB's San Diego Municipal Permit (NPDES No. CAS0109266), a Standard Urban Stormwater Mitigation Plan (SUSMP) was developed for San Diego County. A Storm Water Management Plan that complies with the criteria provided in the SUSMP must be developed for applicable priority development projects in San Diego County.

General Setting

The Proposed Project is situated in the San Diego Basin, within the Pueblo Hydrologic Unit (908.00) and the Lindbergh Hydrologic Subarea (908.21). Based on topography, surface water in the Proposed Project area appears to flow south and southwest.

San Diego is considered to have a Mediterranean climate, with sunny days 70 percent of the year. Most of San Diego County's annual rainfall occurs during the winter months, with 50

percent of the rainfall occurring from December to February. Only two percent of the annual rainfall occurs during the summer months. Annual average precipitation for the Proposed Project area is approximately 10 inches per year, with the majority of precipitation falling between December and April. Rainfall between June and October averages less than 0.5 inch per month. The Proposed Project area is relatively flat and sits at approximately 30 to 70 feet above mean sea level.

Surface Waters

As described in Attachment 4.4-B: Biological Survey Memo, a small concrete-lined drainage designed for storm water conveyance is located on the west side of the proposed Vine Substation site. The channel is an approximately 12-inch wide concrete v-ditch that was designed for storm water conveyance. There was no vegetation or accumulated sediment observed within the channel. No surface waters are located in the Proposed Project footprint or in other areas surrounding the Proposed Project. No surface waters will be crossed by the Proposed Project.

Groundwater

Groundwater basins can be found along major drainages in San Diego County. Groundwater recharge occurs from dam releases and underflow past existing dams. Other sources of recharge may include precipitation, stream flow, and discharges from municipal wastewater treatment plants.

Groundwater was encountered in the Proposed Project area at a depth of approximately 25 feet below the existing ground surface at the time when exploratory borings were conducted. Groundwater levels may fluctuate due to seasonal variations in weather. The exploratory borings for the Proposed Project were performed during a season characterized with relatively little rainfall. As a result, the relatively dry year could have resulted in lower-than-normal groundwater levels.

Surface Water Quality

The Basin Plan designates beneficial uses for surface and groundwaters in the basin, and it also sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state's antidegradation policy. Beneficial uses of inland surface waters near the Proposed Project area include recreation, wildlife habitat, and warm freshwater habitat.

The Proposed Project lies within the Pueblo San Diego Watershed. Pollutants of concern in this watershed include trace metals, coliform bacteria, pesticides, and nutrients. Sewer overflows, storm water runoff, and habitat degradation are all factors that may be impairing surface water quality in this watershed. No known or impaired waterbodies will be crossed by the Proposed Project.

Floodplains

According to FEMA's Flood Insurance Rate Maps, the site is in FEMA Zone X. The Proposed Project does not cross or lie within a 100-year or 500-year flood zone.

Dam Failure Inundation Areas

The Office of Emergency Services is responsible for the identification of inundation areas for dam failures in California. The Proposed Project is not located within an inundation area for dam failure.

4.9.3 Impacts

Significance Criteria

According to Appendix G of the California Environmental Quality Act (CEQA) Guidelines, impacts to hydrology and water quality would be considered significant if the Proposed Project:

- Violates any water quality standards or waste discharge requirements
- Substantially depletes groundwater supplies or interferes substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level
- Substantially alters the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on site or off site
- Substantially alters the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increases the rate or amount of surface runoff in a manner that would result in flooding on site or off site
- Creates or contributes to runoff water that would exceed the capacity of existing or planned storm water drainage systems, or provides substantial additional sources of polluted runoff
- Otherwise substantially degrades water quality
- Places housing within a 100-year flood hazard area, as mapped on a federal Flood Hazard Boundary, Flood Insurance Rate Map, or other flood hazard delineation map
- Places structures that would impede or redirect flood flows within a 100-year flood hazard area
- Exposes people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam
- Causes inundation by seiche, tsunami, or mudflow

Question 4.9a – Water Quality Standards and Waste Discharge Violations

Construction – Less-than-Significant Impact

Construction of the Proposed Project will result in ground-disturbing activities that will expose soil to erosion and subsequent sedimentation. Sediment transport from construction work areas

to adjacent water resources could contribute to water quality degradation and violate RWQCB standards. Sedimentation from work areas will primarily occur from vehicle tracking and soil transport onto adjacent paved surfaces. Sediment transport from work areas, including at the proposed Vine Substation, could also occur from surface water run-on and runoff, heavy precipitation, or overwatering during dust-abatement activities. The proposed Vine Substation site has been previously graded and slopes gently to the southwest. The erosion potential at most of the work areas is low, primarily because of flat to gentle terrain. However, the erosion potential will increase during construction when the soils become disturbed, and when vehicles and equipment enter and exit work areas.

Equipment and construction materials stored within the substation, right-of-way, and staging areas could come in contact with rainwater or storm water runoff that could potentially transport deleterious substances overland to the nearby water resources. Hazardous materials used during construction (e.g., diesel fuel, hydraulic fluid, oils, grease, and concrete) can be transported by storm water runoff and threaten aquatic life. A list of hazardous materials that are anticipated to be used during construction is included in Table 4.8-1: Hazardous Materials Typically Used for Construction and/or Operation and Maintenance in Section 4.8 Hazards and Hazardous Materials. In addition, storm water contact with litter and/or construction materials could pose a threat to nearby water quality. The Proposed Project area is located approximately 0.75 mile northeast of the San Diego Bay, and no known or impaired waterbodies will be crossed by the Proposed Project.

Wastewater will be generated by construction workers over the approximately 19-month construction duration of the Proposed Project. However, the amount of wastewater generated during the short construction period will be minimal and will be contained within portable restrooms before being treated and disposed of by a licensed contractor. No wastewater will be discharged from the site.

Potential impacts to water quality will be minimized through implementation of the SWPPP, SPCC Plan, and the BMPs in SDG&E's Water Quality Construction BMP Manual. As a result, the Proposed Project will result in a less-than-significant impact to water quality and waste discharge requirements.

Operation and Maintenance – Less-than-Significant Impact

BMPS will provide permanent stabilization for all areas that are disturbed during construction of the Proposed Project. For the proposed Vine Substation, this will include installation of road base or gravel and landscaping. Daily operation and maintenance of the Proposed Project will not impact water quality or result in discharges to waters because existing roads will be used to access Proposed Project components.

Operation and maintenance activities will include routine inspection, maintenance, and repair activities. The 69 kV loop-in insulators may require washing up to three times a year to prevent flashovers, equipment damage, and outages. Water used for insulator washing will be allowed to naturally percolate on site; therefore, the operation phase of the Proposed Project is not anticipated to generate any wastewater. SDG&E operation and maintenance personnel may use oils, paint, or solvents in the course of routine maintenance of the substation equipment. These

materials will not be stored or disposed of at the substation site and their use will conform to applicable laws and regulations governing the use, management, and disposal of hazardous materials.

The proposed Vine Substation, at ultimate build-out, will include four oil-filled transformers with a total maximum capacity of approximately 30,000 gallons of oil. These transformers will have the potential to leak hazardous oil. In order to minimize impacts, oil spill containment basins will be installed around the transformers to capture any oil that accidentally leaks from these components. The basins will be designed to have a capacity that exceeds the transformer capacity by 10 percent. In addition, a copy of the substation's SPCC Plan will be maintained at SDG&E's Kearny Operating & Maintenance Center and will contain specific procedures for managing hazardous materials during the operation phase of the Proposed Project. Therefore, an accidental spill is not anticipated to result in a water quality violation and impacts will be less than significant.

Question 4.9b – Groundwater Depletion or Recharge

Construction – Less-than-Significant Impact

Groundwater is not anticipated to be encountered during construction of the proposed Vine Substation, 12 kV distribution relocation, or the telecommunication system extension because the required excavation depths are less than the depth to groundwater in the Proposed Project area. However, groundwater may be encountered during the foundation excavation for steel pole installation for the 69 kV loop-in. Groundwater was encountered in the Proposed Project area at a depth of approximately 25 feet at the time when exploratory borings were conducted. The foundation excavation for steel pole installation will range from 20 to 45 feet in depth. In the event that groundwater is encountered, dewatering systems may be used to dispose of groundwater, as outlined in SDG&E's Water Quality Construction BMP Manual. Typically, groundwater will be pumped into a desiltation tank (i.e., baker tank) and will be discharged to land in accordance with RWQCB regulations, transported to a nearby sewer inlet with approval from the local wastewater treatment facility owner, or disposed of at an approved SDG&E disposal site. In any of these cases, the amount of groundwater withdrawal is expected to be negligible and not have any effect on existing groundwater supplies. Water required for dust control will be obtained from a municipal source and will not affect local groundwater supplies. Any groundwater encountered during construction will not be used for dust control. Further, construction is not expected to interfere with storm water infiltration and/or groundwater recharge because the site will be approximately 100-percent pervious during the construction phase. Therefore, impacts to groundwater supplies and recharge will be less than significant.

Operation and Maintenance – No Impact

A limited amount of water will be required to allow for long-term operation and maintenance of the proposed Vine Substation. Water use will be limited to irrigation of any on-site landscaping associated with the facilities (i.e., revegetative groundcover or landscape screening). Water will be obtained from permitted municipal sources that can provide an adequate water supply to the site.

The amount of impervious surfaces resulting from construction of the Proposed Project will be similar to the existing conditions within the Proposed Project limits. The proposed location of the proposed Vine Substation is within a paved parking lot and the other Proposed Project components are located within existing paved roads. Rainwater and storm water runoff will continue to infiltrate the ground surface, similar to pre-construction conditions. As such, no net change is anticipated in the amount of storm water released from the Proposed Project area. With or without the Proposed Project, the same amount of water will recharge the groundwater table. Therefore, no impact will occur as a result of operation and maintenance activities.

Question 4.9c – Drainage Patterns – Erosion/Siltation

Construction – Less-than-Significant Impact

The Proposed Project area is relatively flat and will be graded with minimal slope, similar to the existing slope found on site. Construction-related activities will result in minor deviations to the existing drainage patterns on site, due to grading and construction of the Proposed Project components. Such changes will not substantially increase the existing velocity or volume of storm water flows either on-site or in off-site areas. All areas disturbed during grading will be restored to their original contours, and the surrounding area will be repaired, as appropriate. Therefore, the drainage patterns in the Proposed Project area will return to near pre-construction conditions and the Proposed Project will not significantly alter the existing on-site drainage patterns or significantly increase the amount of runoff generated from the site. No net change will occur in the amount of storm water released from the project area, which will preclude any off-site soil erosion that may otherwise result.

The Proposed Project will not alter the course of any waterways because no streams or rivers are located within the Proposed Project area. Impacts to drainage patterns, as well as subsequent erosion and off-site siltation resulting from construction of the Proposed Project, will be less than significant.

Operation and Maintenance – No Impact

On-site drainage patterns established during construction will generally remain unchanged with long-term operation and maintenance of the proposed Vine Substation. The proposed grading improvements are not anticipated to result in impacts from increased on- or off-site erosion or siltation. As such, no impacts resulting from on-site or off-site drainage patterns are anticipated with operation and maintenance of the facilities.

Question 4.9d – Drainage Patterns – Runoff/Flooding

Construction – Less-than-Significant Impact

As discussed in the response to Question 4.9c, construction-related activities will result in minor deviations to the existing drainage patterns on site, due to grading and construction of the Proposed Project components. Such changes will not substantially increase the existing velocity or volume of storm water flows on site or in off-site areas. As such, flow rates and volumes will not be substantially altered and potential impacts from runoffs or flooding will be less than significant.

Operation and Maintenance – No Impact

Once construction of the Proposed Project facilities and associated improvements has been completed, no additional changes to on-site or off-site drainages are anticipated. The Proposed Project will not result in the potential for increased runoff volumes, and storm water facilities in the surrounding area will not be further affected. Therefore, no impact resulting from storm water runoff or flooding is anticipated with operation and maintenance of the Proposed Project.

Question 4.9e – Storm Water Runoff

Construction – Less-than-Significant Impact

The enclosed area of the proposed Vine Substation will occupy approximately 1.3 acres. The proposed Vine Substation will be located within a paved parking lot and development of the site will commence with the removal of the paved surface. Once cleared, remedial grading will take place based on the recommendations of the geotechnical investigation, which will determine the appropriate on-site pad elevation and foundation support that also maintain adequate site drainage. Runoff from the site is not expected to change substantially from pre-construction conditions. Consequently, there will be a less-than-significant impact to existing storm water conveyance systems.

The volume of storm water during construction of other Proposed Project components is expected to be the same as it was prior to construction because limited grading is required to install power line poles and trenching is required to construct the duct banks. Pre-construction contours and elevations will be re-established following the completion of construction; therefore, storm water runoff is anticipated to remain unchanged when compared to pre-construction conditions. Construction will introduce new sources of pollutants that could enter storm water and be transported off site. Sources of pollutants are discussed in detail in response to Question 4.9a. Such pollutants include hazardous materials (e.g., diesel fuel, hydraulic fluid, oil, and grease), as well as typical construction materials, sediment, and trash. With implementation of the SWPPP and BMPs in the SDG&E's Water Quality Construction BMP Manual, impacts associated with introducing pollutants to storm water runoff will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Surface runoff following the completion of construction is expected to be similar to the existing conditions due to a minimal amount of new, impermeable surfaces compounded with the greater amount of existing impermeable surfaces to be removed. Minimal impacts will occur to existing storm water conveyance systems and minor alterations of existing culverts, catch basins, or drains may be required to accommodate the Proposed Project during the operation and maintenance phase. Steel poles, conductor, and substation equipment will be exposed to storm water; however, these materials are not readily soluble or considered to contribute to water quality degradation.

Maintenance activities—such as routine inspections, pole replacements, and conductor work—can introduce pollutants that are similar to those that are typical during construction. Any material or equipment needed to make a repair will be brought to the site and then returned to an SDG&E maintenance yard upon completion. In addition, SDG&E will implement standard

protocols in accordance with state and federal regulations to control, contain, clean up, and dispose of any pollutants that may occur during maintenance activities.

Fertilizers and soil amendments may be used to facilitate plant growth around the perimeter of the substation site in accordance with the landscaping plans. Fertilizers or other soil amendments will be used according to the manufacturer's specifications and in quantities that minimize the potential to reach nearby waterways. As a result, impacts from storm water runoff will be less than significant.

Question 4.9f – Water Quality Degradation – *Less-than-Significant Impact*

Potential sources of pollutants and activities that can contribute water quality degradation are discussed in detail in response to Question 4.9a. No other foreseeable sources of pollution are anticipated to be associated with construction or operation of the Proposed Project. As a result, impacts will be less than significant.

Question 4.9g – Housing in Flood Hazard Areas – *No Impact*

No housing will be constructed as part of the Proposed Project. Therefore, no housing will be placed within a 100-year flood hazard area, and no impact will occur.

Question 4.9h – Structures in Flood Hazard Areas – *No Impact*

According to the FEMA Flood Plain Map, the Proposed Project is not located within the 100-year flood hazard boundary. No new structures will be constructed that will impede or redirect flood flow within a 100-year flood hazard area. As a result, the Proposed Project will not result in any impacts associated with flood zones.

Question 4.9i – Flood Exposure – *No Impact*

Proposed Project construction will not expose people or structures to a significant risk of loss, injury, or death due to flooding, as no on-site or off-site flood impacts are expected, as described in the response to Question 4.9h. No permanent buildings will be placed in a known 100-year flood hazard area. Thus, no impacts will occur.

Question 4.9j – Flooding, Seiche, Tsunami, and Mudflow – *Less-than-Significant Impact*

The Proposed Project area is located approximately 0.75 mile from the San Diego Bay, which is a large body of water with access to the Pacific Ocean and is susceptible to tsunamis. Given the distance from the Pacific Ocean, it is unlikely that a tsunami will cause catastrophic damage to the Proposed Project area. Because the Proposed Project does not involve housing, impacts that will result from a tsunami are expected to be less than significant.

Seiches are typically associated with impounded waterbodies. The Proposed Project will not be located near any lakes or other impounded waterbodies; therefore, no impact from seiches will occur.

A mudflow is a flow of soil and debris that occurs after intense rainfall, earthquakes, or severe wildfires. The potential for a mudflow to occur depends on the slope steepness, soil type, and

soil moisture content. Given that the Proposed Project area is nearly flat and most of the area is paved, a mudflow will not occur. Therefore, no impact is anticipated.

4.9.4 Applicant-Proposed Measures

The Proposed Project will result in a less-than-significant impact to hydrology and water quality with implementation of the Proposed Project's SWPPP and SPCC Plan, which are both required by law, and with implementation of the BMPs in SDG&E's Water Quality Construction BMP Manual as described in Chapter 3 – Project Description. Therefore, no applicant-proposed measures are proposed.

4.10 LAND USE AND PLANNING

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Physically divide an established community?				✓
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?				✓
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?				✓

4.10.0 Introduction

This section describes the existing and designated land uses in the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and analyzes potential land use impacts that may result from construction and operation of the Proposed Project. Construction of the Proposed Project will not result in significant impacts to existing or proposed land uses, nor will it physically divide an established community. In addition, the Proposed Project will be compatible with relevant land use and environmental plans and policies adopted by local governments.

4.10.1 Methodology

The land use analysis involved a review of various land use plans, policies, and regulations for the City of San Diego, including the City of San Diego General Plan and Municipal Code, as well as the Midway/Pacific Highway Corridor Community Plan. The San Diego County Regional Airport Authority Airport Land Use Compatibility Plan (ALUCP) for San Diego International Airport (SDIA) was also reviewed. The land use analysis also involved a study of Google Earth aerial imagery of the Proposed Project area. In addition, SDG&E's Subregional Natural Community Conservation Plan (NCCP) and the City of San Diego's Multiple Species Conservation Program (MSCP) were reviewed.

4.10.2 Existing Conditions

Regulatory Background

Pursuant to Article XII, Section 8 of the California Constitution and the California Public Utilities Code, the California Public Utilities Commission (CPUC) maintains jurisdiction at the

local level to regulate the design, siting, installation, operation, maintenance, and repair of electric transmission facilities. However, the CPUC encourages—and SDG&E participates in—discussions with local governments to address their concerns where feasible. In addition, SDG&E is required to obtain ministerial permits from local agencies when applicable. The following subsections consider relevant land use plans, policies, and guidelines, and analyze potential impacts resulting from the Proposed Project with regard to land use and planning.

City of San Diego

The Proposed Project is located within the City of San Diego and is subject to the City of San Diego General Plan, which provides a framework of policies, objectives, and land use designations to guide long-term development. The City of San Diego Municipal Code supports the General Plan and provides specific development regulations for lands within the individual zoning designations. The Proposed Project area is also subject to the Midway/Pacific Highway Corridor Community Plan, which identifies goals, objectives, and recommendations for the area and establishes a vision for the future form of the community. The Proposed Project area is located east of the SDIA within the Approach Overlay Zone, and is subject to the regulations, policies, and requirements contained within the SDIA ALUCP. These plans, along with the existing uses, are described in relation to the Proposed Project in the following sections.

Existing Land Uses

Proposed Vine Substation and 69 kV Loop-In

The proposed Vine Substation will be located on an approximately 1.5-acre parcel purchased by SDG&E for use as a substation. The new poles associated with the 69 kV loop-in will be located to the west of the proposed substation site on land that is within the existing public road right-of-way (ROW) franchise. The substation parcel is currently used as an approximately 240-space long-term airport parking lot. The site is generally flat with minimal vegetation. A dense collection of ornamental and non-native species is located directly adjacent to and west of the site and there are six existing palm trees located along the eastern boundary of the site, between the paved parking lot and the adjacent sidewalk. The southern fence is covered in non-native ivy. The parcel is bordered to the north by Vine Street (and a commercial printing business across Vine Street), to the south by an Advantage Rental Car facility, to the east by Kettner Boulevard, and to the west by the Amtrak Pacific Surfliner, North County Transit District Coaster and San Diego Metropolitan Transit System Trolley railroad tracks. The 69 kV loop-in poles will be located on the west side of these railroad tracks adjacent to Pacific Highway. The area is characterized by light- and medium-industrial, commercial, and office uses; parking lots; and rental car facilities.

12 kV Distribution Relocation

The relocated distribution circuits will be installed within new underground duct banks within Kettner Boulevard from the proposed Vine Substation to West Laurel Street. The approximately 0.75-mile-long alignment will be located within the Kettner Boulevard public ROW. South of West Laurel Street, the distribution circuits will utilize existing conduits for approximately 0.3 mile within Pacific Highway and Kettner Boulevard. Existing uses in the surrounding area include Interstate (I-) 5, rental car facilities, offices, general commercial uses, hotels, and parking lots.

Designated Land Uses

City of San Diego General Plan

As shown in Table 4.10-1: Existing and Designated Land Uses, the proposed Vine Substation and 69 kV loop-in will be located on a site that is designated Industrial Employment. Lands adjacent to the relocated distribution circuits have a General Plan designation of Industrial Employment at the northern end of the line and Multiple Use and Commercial Employment Retail and Services at the southern end. A wide variety of land uses are specified as being appropriate within these designations, including offices, general commercial uses, civic facilities, and light and heavy industrial uses. While utility uses are not explicitly designated as being allowed under these General Plan designations, the General Plan specifically discusses the need to integrate design elements and space requirements necessary for public utilities into planning efforts throughout the city. Figure 4.10-1: Land Use Map presents a depiction of the general land use categories within the Proposed Project area.

Table 4.10-1: Existing and Designated Land Uses

Proposed Project Component	Existing Land Use	General Plan Designation	Zoning Designation	Community Plan Designation
Vine Substation	Parking lot	Industrial Employment	IS-1-1	Light Industrial
12 kV Distribution Relocation	Public street ROW	Industrial Employment, Commercial Employment Retail and Services, Multiple Use	IS-1-1, CC-4-2, CCDC, CCPD-MC	Light Industrial, Transportation Related
69 kV Loop-In	Public street ROW	Industrial Employment	IS-1-1	Light Industrial

Note: The Telecommunication System Extension will be collocated with portions of the 12 kV Distribution Relocation and 69 kV Loop-in.

Sources: City of San Diego General Plan, 2008; City of San Diego General Plan Land Use Map, July 2010; City of San Diego Municipal Code; City of San Diego Zoning Map, June 2009; Midway/Pacific Highway Corridor Community Plan, 1991.

City of San Diego Municipal Code

The proposed Vine Substation, 69 kV loop-in, and the northern portion of the 12 kV distribution relocation are zoned IS-1-1 (Industrial Small Lot), which allows small- and medium-sized industrial and commercial activities promoting economic vitality and neighborhood scale. The southern portion of the 12 kV distribution relocation is zoned CC-4-2, CCDC, and CCPD-MC (Community Commercial designations), which are intended to accommodate high-density commercial uses with strip commercial characteristics, as well as general commercial uses. Utility-related uses—such as power lines, switching stations, and communications facilities—are allowed uses (generally with a Conditional Use Permit) under the IS-1-1, CC-4-2, CCDC, and CCPD-MC zoning designations.

Midway/Pacific Highway Corridor Community Plan

The proposed Vine Substation, 69 kV loop-in, and a portion of the 12 kV distribution relocation (the section north of Laurel Street) are subject to the Midway/Pacific Highway Corridor Community Plan. The plan establishes guidelines for the form of the community and provides specific recommendations for land uses designed to meet the existing and future needs of the community. The Midway/Pacific Highway Corridor Community Plan also recommends actions that will implement the goals and objectives of the City of San Diego's General Plan. The Proposed Project area is designated as Light-Industrial and Transportation Related, though specific use regulations are not contained within the document for this designation. However, the Midway/Pacific Highway Corridor Community Plan does call for a substation at the proposed Vine Substation site in order to meet the electrical power needs of the community. In addition, the plan states that utility lines are recommended to be located underground.

City of San Diego Local Coastal Program

The Proposed Project area is located outside of the City of San Diego Coastal Zone, except for the approximately 0.3-mile portion of the 12 kV distribution relocation that will be placed underground in an existing conduit within Pacific Highway.

SDIA ALUCP

The ALUCP is implemented to protect the public's health, safety, and welfare and to prevent encroachment from degrading the operational capability of the airport. The ALUCP provides the requisite analysis of noise levels, accident potential, and obstruction clearance criteria necessary for safe airport operations. The Proposed Project is located within the SDIA Approach Overlay Zone, as shown in the ALUCP.

NCCPs/Habitat Conservation Plans

In 1995, SDG&E entered into an agreement with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW), establishing its Subregional NCCP. The NCCP is intended to establish and implement an agreement between SDG&E, the USFWS, and the CDFW for the long-term preservation of sensitive habitat and animal species while allowing SDG&E to develop, operate, and maintain its facilities. The Proposed Project components are located on lands affected by SDG&E's Subregional NCCP. Relevant policies related to land use were not identified within the Subregional NCCP. The Subregional NCCP is further addressed in Section 4.4 Biological Resources.

No habitat conservation plans (HCPs) were identified as relevant to the Proposed Project area.

City of San Diego MSCP

The Proposed Project is located within the boundaries of the City of San Diego's MSCP Subarea Plan. The MSCP Subarea Plan establishes the conditions under which the City of San Diego—for the benefit of itself, public and private landowners, and other land development project proponents within its subarea boundaries—will receive take authorizations from the USFWS and CDFW; however, take authorization is not anticipated to be required for the Proposed Project. Section 4.4 Biological Resources provides a further description of the MSCP Subarea Plan.

4.10.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the California Environmental Quality Act Guidelines. Impacts to land use and planning would be considered significant if the Proposed Project:

- Physically divides an established community
- Conflicts with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Proposed Project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect
- Conflicts with any applicable HCP or NCCP

Question 4.10a – Physical Division of an Established Community – *No Impact*

The Proposed Project site is located in a highly urbanized area of San Diego. The area supports a variety of light industrial and commercial uses. The Proposed Project area is bound by public streets, commercial and industrial uses, and a rail line. Further, I-5 is located to the east and the SDIA is located to the west. The proposed underground 12 kV distribution relocation and portions of the telecommunication system extension will be located within public streets bordered by similar light industrial and commercial uses. No residential uses occur within the area immediately surrounding the Proposed Project. Because of the developed, infrastructure-heavy, mixed commercial-industrial nature of the Proposed Project area—and the fact that there are numerous major roadways and rail lines in the vicinity—there are no existing established communities that will be physically divided as a result of the Proposed Project. Thus, no impact will occur.

Access to businesses and other uses in the area surrounding the Proposed Project site will generally be maintained during the construction phase. Although it is not anticipated that the Proposed Project will require any road closures, temporary lane closures will be required for the for installation of the underground distribution lines and telecommunications system. Additional lane and/or road closures may be required for the installation of the 12 kV distribution relocation and 69 kV loop-in. However, such traffic control measures will be temporary and short-term. Lane and/or road closures will generally night for the 12 kV distribution relocation and during the day for the 69 kV loop-in. These land and/or road closures are not anticipated to create a division between area land uses or within the larger community. In addition, the Proposed

Project will obtain and comply with the requirements of a City of San Diego ROW permit and any roadway restrictions will be coordinated with the city. Therefore, no impact will occur.

Operation and maintenance activities of the Proposed Project will be the similar to those currently performed by SDG&E in the area to maintain existing facilities (in particular, the Kettner Substation) and will occur on land owned by SDG&E or within public road ROWs. Such activities do not currently divide an established community, nor will they be anticipated to do so as a result of the Proposed Project; therefore, there will be no impact.

Question 4.10b – Plans and Policy Conflicts – *No Impact*

A summary of the Proposed Project's consistency with applicable goals and policies is provided in Table 4.10-2: Applicable Land Use Plans and Policies Consistency Analysis. Consistency with the City of San Diego General Plan and Midway/Pacific Highway Corridor Community Plan are specifically discussed. The Proposed Project does not conflict with these applicable plans and their respective policies.

The proposed Vine Substation, 69 kV loop-in, 12 kV distribution relocation, and telecommunication system extension will be located within areas designated as Industrial Employment, Commercial Employment Retail and Services, and Multiple Use by the City of San Diego's General Plan, and areas zoned for commercial and industrial uses by the Municipal Code. As previously stated, a variety of land use types are allowed within these designations, including general commercial uses, as well as light and heavy industrial uses. Substations are typically considered an allowed use (or are allowed with a Conditional Use Permit) within these areas. Further, the Midway/Pacific Highway Corridor Community Plan specifically calls for a substation at the proposed Vine Substation site in order to meet the electrical power needs of the community. Therefore, the Proposed Project will not conflict with applicable City of San Diego land use plans, and there will be no impact.

Because the project is located within the SDIA Approach Overlay Zone per the ALUCP and the City of San Diego Municipal Code, an Obstruction Evaluation will be conducted by the Federal Aviation Administration (FAA) prior to construction. The Proposed Project will comply with all FAA requirements resulting from the Obstruction Evaluation, including the potential incorporation of lighting and signage on the poles or within the substation. Because the Proposed Project will comply with all FAA requirements, no conflict with the ALUCP or requirements of the SDIA Approach Overlay Zone will occur. Therefore, there will be no impact.

As previously stated, the Proposed Project lies within the boundaries of the SDG&E Subregional NCCP and the city's MSCP Subarea Plan. However, no land use-related policies were identified within those documents. Therefore, no impact will occur as a result of construction, operation, or maintenance of the Proposed Project.

Table 4.10-2: Applicable Land Use Plans and Policies Consistency Analysis

Plan or Policy	Consistent? (Yes/No)	Explanation
City of San Diego General Plan		
Land Use and Community Planning Element		
Airport Land Use Compatibility Goal: Protection of the health, safety, and welfare of persons within an airport influence area by minimizing the public's exposure to high levels of noise and risk of accidents.	Yes	The proposed Vine Substation will be unstaffed and operated remotely. This will reduce employee exposure to noise and potential aircraft hazards as compared to other allowed uses, such as industrial or office uses. Thus, the Proposed Project will be consistent with this goal.
Policy LU-G.5: Implement the height standards used by the FAA as defined by Code of Federal Regulations Title 14, Part 77 through development regulations and zoning ordinances.	Yes	The Proposed Project site is within 20,000 feet of a public use airport with a runway measuring more than 3,200 feet, so it is subject to obstruction evaluation. The tallest component of the proposed Vine Substation will be the steel substation support components, which will reach approximately 30 feet above the ground surface, and the new poles associated with the 69 kV loop-in, which will reach approximately 100 feet. Although a determination will be required from the FAA, the Proposed Project is not anticipated to conflict with FAA height standards. In addition, the Proposed Project will implement any lighting or signage requirements from the FAA. The Proposed Project will be consistent with this policy.
Public Facilities, Services, and Safety Element		
Goals		
Public utility services provided in the most cost-effective and environmentally sensitive way.	Yes	The Proposed Project is intended to provide improved substation and circuit reliability, as well as reduce area substation loading conditions. In addition, the Proposed Project has been designed to reduce potential environmental impacts to a less-than-significant level or to avoid impacts to sensitive resources. As a result, the Proposed Project will be consistent with this goal.

Plan or Policy	Consistent? (Yes/No)	Explanation
Public utilities that sufficiently meet existing and future demand with facilities and maintenance practices that are sensible, efficient, and well-integrated into the natural and urban landscape.	Yes	As stated previously, the Proposed Project is intended to effectively meet the area's electric capacity needs, provide improved substation and circuit reliability, and reduce area substation loading conditions. The Proposed Project will be consistent with surrounding industrial and commercial land uses and will be designed to avoid impacts to sensitive resources to the extent possible.
Policies		
PF-M.1: Ensure that public utilities are provided, maintained, and operated in a cost-effective manner that protects residents and enhances the environment.	Yes	The Proposed Project is intended to provide improved substation and circuit reliability with added tie-in capacity and reduce area substation loading to optimum operating conditions. In addition, the proposed Vine Substation will be located on a site that has been identified as an appropriate site for a substation per the Midway/Pacific Highway Corridor Community Plan. The Proposed Project is consistent with this policy.
PF-M.4: Cooperatively plan for and design new or expanded public utilities and associated facilities (e.g., telecommunications infrastructure, planned energy generation facilities, gas compressor stations, gas transmission lines, electrical substations and other large-scale gas and electrical facilities) to maximize environmental and community benefits. b. Provide adequate buffering and maintained landscaping between utility facilities and residential and non-residential uses, including the use of non-building areas and/or rear setbacks.	Yes	As stated previously, the proposed Vine Substation will be located on a site that has been identified as appropriate for a substation per the Midway/Pacific Highway Community Plan. The substation will be visually shielded from views by a perimeter wall and new landscaping. In addition, there are very limited residential uses in the vicinity of the Proposed Project. Therefore, the Proposed Project is consistent with this policy.

Plan or Policy	Consistent? (Yes/No)	Explanation
Mobility Element Policies		
ME-A.5: Provide adequate sidewalk widths and clear path of travel, as determined by street classification, adjoining land uses, and expected pedestrian usage. a. Minimize obstructions and barriers that inhibit pedestrian circulation.	Yes	While temporary sidewalk closures may be required during construction of the 12 kV distribution relocation, this work is anticipated to occur at night when pedestrian traffic will be limited. If sidewalk closures are required for any portion of the Proposed Project, alternative pedestrian walking routes around construction areas will be provided. In addition, Proposed Project vaults will be placed underground and any above-ground fixtures will be placed so that they do not obstruct pedestrian circulation in the area. Thus, the Proposed Project is consistent with this policy.
Midway Pacific Highway Corridor Community Plan		
Design Guidelines		
Storage yards, parking areas and outdoor assemblage areas which are visible from the public ROW should be screened. Solid walls or facades should be broken up with recesses and visually softened by landscaping. If feasible, landscaped areas should be placed between the fence and the sidewalk.	Yes	The proposed Vine Substation will be visually shielded from views by a perimeter wall and new landscaping. Thus, the Proposed Project is consistent with this guideline.

Question 4.10c – Habitat Conservation Plan or Natural Community Conservation Plan Conflicts – *No Impact*

SDG&E's existing NCCP and the City of San Diego's MSCP Subarea Plan are the only conservation plans that are relevant to the Proposed Project area. The NCCP addresses potential impacts to sensitive resources associated with SDG&E's ongoing installation, use, maintenance, and repair of its gas and electric systems, as well as typical expansions of those systems throughout SDG&E's existing service area. The NCCP was developed in coordination with the USFWS and CDFW, and designed to be consistent with local habitat conservation plans and the overall preserve planning effort, including the City of San Diego's MSCP Subarea Plan. The NCCP protocols will be applied to the Proposed Project to avoid and/or minimize potential impacts resulting from construction of the Proposed Project, as further described in Section 4.4 Biological Resources. Therefore, the Proposed Project will not conflict with any applicable conservation plan, and no impacts will occur.

Operation and maintenance activities for the Proposed Project will be the similar to those currently performed by SDG&E in the area to maintain existing facilities. While the Proposed Project is located in an urban area with limited biological resources, NCCP protocols will still be applied as they are currently in order to avoid and/or minimize potential species impacts during operation and maintenance activities. Because SDG&E will utilize its existing NCCP during operation and maintenance activities for the Proposed Project, there will be no conflict with the plan and no impact will occur.

4.10.4 Applicant-Proposed Measures

No conflicts with applicable land use plans or policies will occur as a result of construction of the Proposed Project. In addition, the Proposed Project will not divide an established community. As such, no applicant-proposed measures are proposed.

4.11 MINERAL RESOURCES

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				✓
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?				✓

4.11.0 Introduction

This section discusses the existing conditions in the area for the proposed San Diego Gas & Electric Company Vine 69/12 Kilovolt Substation Project (Proposed Project) and assesses potential impacts that may occur to mineral resources as a result of Proposed Project implementation. Because there are no known mineral resources that will be crossed by the Proposed Project, it will not have an impact on local or regional mineral resources. In addition, no impacts to mineral resources will result from construction or operation and maintenance activities required for the proposed facilities.

4.11.1 Methodology

Mineral resource data were obtained from the City of San Diego General Plan and the California Department of Conservation (DOC).

4.11.2 Existing Conditions

Regulatory Background

The following subsections detail federal, state, and local plans and policies pertaining to mineral resources that are relevant to the Proposed Project.

State

Surface Mining and Reclamation Act of 1975

The California Geological Survey designates mineral resource zones where access to important mineral resources may be threatened, according to provisions of the California Surface Mining and Reclamation Act (SMARA) of 1975. The SMARA requires that all jurisdictions incorporate mapped mineral resource designations approved by the State Mining and Geology Board (SMGB) into their general plans. The SMGB and the DOC's Office of Mine Reclamation (OMR) are jointly charged with ensuring proper administration of the SMARA's requirements.

The SMGB promulgates regulations to clarify and interpret the SMARA's provisions, as well as to serve as a policy and appeals board. The OMR provides an ongoing technical assistance program for lead agencies and operators, maintains a database of mine locations and operational information statewide, and is responsible for compliance-related matters.

Local

City of San Diego General Plan

The City of San Diego Planning Division maintains and implements the City of San Diego General Plan and ensures regulatory compliance with city codes and ordinances. The Conservation element of the General Plan identifies the location of high-quality mineral resource areas in San Diego that are designated for the managed production of mineral resources. The General Plan notes that mineral deposits that are acceptable for use as Portland Cement Concrete grade aggregate are the rarest and most valuable aggregate resources. Extraction activities occur in Mission Valley and other areas of San Diego, such as Carroll Canyon and Mission Gorge. Mining operations also occur within the Multiple Species Conservation Program subarea plan, primarily consisting of sand, rock, and gravel extraction.

Environmental Setting

The Proposed Project site is located in a developed industrial area of the City of San Diego. No known mineral resources have been identified on the Proposed Project site or in the surrounding vicinity. No areas with known or inferred occurrences of mineral resources are located within five miles of the Proposed Project.

4.11.3 Impacts

Significance Criteria

Under the California Environmental Quality Act, impacts to mineral resources would be considered significant if the Proposed Project:

- Results in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state

- Results in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan

Question 4.11a – Loss of Regional- or State-Valued Mineral Resources – *No Impact*

The proposed Vine Substation site and associated Proposed Project work areas are located in a developed, urbanized area within the City of San Diego. The Proposed Project does not cross any known mineral resources. Therefore, no known mineral resources will be lost due to Proposed Project-related construction or operation and maintenance activities, and no impact will occur.

Question 4.11b – Loss of Locally Important Mineral Resources – *No Impact*

There are no known locally important mineral resources located on the proposed Vine Substation site or within the Proposed Project work areas. No active mining operations or known areas

designated or delineated for mineral resource recovery are located within the Proposed Project area. In addition, no known mineral resources that have noted value to the region or to the residents of the state will be impacted by construction or operation of the Proposed Project. Therefore, no impacts will occur.

4.11.4 Applicant-Proposed Measures

Because the Proposed Project will have no impact on mineral resources, no applicant-proposed measures are proposed.

4.12 NOISE

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			✓	
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			✓	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?			✓	
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?			✓	
e) If located within an airport land use plan or within two miles of a public airport or public use airport for which such a plan has not been adopted, would the project result in exposure of persons residing or working in the project area to excessive noise levels?			✓	
f) If located within the vicinity of a private airstrip, would the project result in exposure of persons residing or working in the project area to excessive noise levels?				✓

4.12.0 Introduction

The purpose of this section is to describe the ambient noise conditions in the vicinity of the proposed San Diego Gas & Electric Company Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and to assess noise impacts that may potentially occur as a result of Proposed Project implementation, particularly with regard to short-term construction activities and long-term operation. Construction of the Proposed Project will not result in a significant increase in temporary, periodic, or permanent ambient noise levels in the Proposed Project area. In addition, the Proposed Project will not expose sensitive receptors to significant vibration levels.

4.12.1 Methodology

Information regarding existing noise sources and standards was obtained from federal, state, regional and local literature reviews to establish the noise standards for the Proposed Project location. Evaluation of potential noise impacts from the Proposed Project included measuring existing noise levels in the vicinity of the Proposed Project site, characterizing the existing noise environment, calculating noise generation from the proposed Vine Substation equipment, and examining typical noise levels resulting from construction and operation activities. The noise analysis focuses on the construction of the proposed Vine Substation, installation of underground duct banks, and installation of the 69 kV loop-in.

4.12.2 Existing Conditions

Regulatory Setting

Federal

No federal noise standards directly regulate noise from operation of electrical power lines and substation facilities. However, in 1974, the United States (U.S.) Environmental Protection Agency (EPA) established guidelines for noise levels, below which no reason exists to suspect that the general population will be at risk from any of the identified effects of noise. The EPA guidelines include the following:

- equivalent sound level (L_{eq})(24) less than or equal to 70 A-weighted decibels (dBA) to protect against hearing loss;[1]

- day-night equivalent noise level (L_{dn}) less than or equal to 55 dBA to protect against activity interference and annoyance in residential areas, farms, and other outdoor areas where quiet is a basis for use;

- L_{eq}(24) less than or equal to 55 dBA to protect against outdoor activity interference where limited time is spent, such as school yards and playgrounds;

- L_{dn} less than or equal to 45 dBA to protect against indoor activity interference and annoyance in residences; and

- L_{eq}(24) less than or equal to 45 dBA to protect against indoor activity interference in school yards.

These levels are not standards, criteria, regulations, or goals, but are defined to protect public health and welfare with an adequate margin of safety, and to provide guidelines for implementing noise standards locally. The federal government has passed various general laws to regulate and limit noise levels, as identified in the following subsections.

[1] The human ear is not uniformly sensitive to all sound frequencies; therefore, the A-weighting scale has been devised to correspond with the human ear's sensitivity. The A-weighting scale uses the specific weighting of sound pressure levels from about 31.5 hertz (Hz) to 16 kilohertz for determining the human response to sound.

Noise Pollution and Abatement Act of 1970

The Noise Pollution and Abatement Act of 1970 established the Office of Noise Abatement and Control (ONAC) within the EPA, authorized to conduct a full and complete investigation of noise and its effect on public health and welfare. The investigation was to include an identification of noise sources, projected noise levels, and effects of noise on persons, animals, and property.

In 1981, the Administration concluded that noise issues were best handled at the state or local government level. As a result, the EPA phased out ONAC's funding in 1982 as part of a shift in the federal noise control policy to transfer the primary responsibility of regulating noise to state and local governments. However, the Noise Control Act of 1972 and the Quiet Communities Act of 1978, which are described in the following sections, were not rescinded by Congress and remain in effect today.

Noise Control Act of 1972

The Noise Control Act of 1972 was the first comprehensive statement of national noise policy. It declares, "It is the policy of the U.S. to promote an environment for all Americans free from noise that jeopardizes their health or welfare."

Quiet Communities Act of 1978

The Noise Control Act was amended by the Quiet Communities Act of 1978 to promote the development of effective state and local noise control programs, to provide funds for noise research, and to produce and disseminate educational materials to the public on the harmful effects of noise and ways to effectively control it.

By 2002, agencies—including the Department of Transportation, Department of Labor, Federal Railroad Administration, and Federal Aviation Administration—developed their own noise control programs, with each agency setting its own criteria.

Occupational Health and Safety Act of 1970

This act covers all employers and their employees in the 50 states, the District of Columbia, Puerto Rico, and other U.S. territories. Administered by the Occupational Health and Safety Administration (OSHA), the act assigns OSHA two regulatory functions—setting standards and conducting inspections to ensure that employers are providing safe and healthful workplaces. OSHA standards may require that employers adopt certain practices, means, methods, or processes that are reasonably necessary and appropriate to protect workers on the job. Employers must become familiar with the standards applicable to their establishments and eliminate hazards. Included in this act is a regulation for worker noise exposure at 90 dBA over an eight-hour work shift. Areas where exposure exceeds 85 dBA must be designated and labeled as high-noise-level areas and hearing protection is required.

Federal Aviation Administration

The Federal Aviation Administration establishes 65 decibels (dB) Community Noise Equivalent Level[2] (CNEL) as the noise standard associated with aircraft noise measured at exterior locations in noise-sensitive land uses[3] (NSLU). This standard is also generally applied to railroad noise.

State

California Noise Control Act

The California Noise Control Act states that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. It also recognizes that continuous and increasing noise levels exists in urban, suburban, and rural areas. This act declares that the State of California has the responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise.

California Noise Insulation Standards

The California Noise Insulation Standards were adopted in 1974 by the California Commission on Housing and Community Development, which was meant to establish noise insulation standards for multi-family residential buildings. This document establishes standards for interior room noise attributable to outside noise sources. The regulations also specify that acoustical studies must be prepared whenever a residential building or structure is proposed to be located near an existing or adopted freeway route, expressway, parkway, major street, thoroughfare, rail line, rapid transit line, or industrial noise source, and where such a noise source or sources create an exterior CNEL (or L_{dn}) of 60 dB or greater. Such acoustical analysis must demonstrate that the residence has been designed to limit intruding noise to an interior CNEL (or L_{dn}) of at least 45 dB.

California Department of Transportation- and Construction-Induced Vibration Guidance

This document provides practical guidance to California Department of Transportation (Caltrans) engineers, planners, and consultants who must address vibration issues associated with the construction, operation, and maintenance of Caltrans projects. Continuous or frequent intermittent vibration sources, such as impact pile drivers, are significant when their peak particle velocity (PPV) exceeds 0.1 inch per second. More specific criteria for human annoyance have been developed by Caltrans and will be used to evaluate potential Proposed Project vibration sources. Table 4.12-1: Human Response to Transient Vibration lists Caltrans' thresholds of perception.

[2] CNEL measurements are weighted averages of sound levels gathered over a 24-hour period, essentially measuring ambient noise. Measurements taken during day, evening, and nighttime periods are weighted separately, recognizing that humans are most sensitive to noise in late night hours and are more sensitive during evening hours than in daytime hours.

[3] NSLU is defined as any residence, hospital, school, hotel, resort, library, or any other facility where quiet is an important attribute of the environment.

Table 4.12-1: Human Response to Transient Vibration

Human Response	PPV (inches/second)
Severe	> 0.9
Strongly Perceptible	0.24 to 0.9
Distinctly Perceptible	0.035 to 0.24
Barely Perceptible	< 0.035

Source: Caltrans, 2004

Local

Local governments outline requirements for noise abatement and control in the noise element of their general plans and municipal codes. These noise elements typically set noise goals and objectives, and the municipal codes set sound-level limits and time-of-day restrictions for activities.

City of San Diego General Plan Noise Element

Noise levels within the City of San Diego are regulated by the city's General Plan. The purpose of the Noise Element in the General Plan is to identify existing conditions and to provide general guidelines that would reduce the negative impact of noise on the community in the future. The General Plan's objective is "to protect people living and working in the City of San Diego from excessive noise."

The City of San Diego has an exterior noise level standard of 65 dB CNEL for noise-sensitive uses. These standards are designed to protect noise-sensitive land uses from high noise levels and to be used as guidelines in the planning for future land uses. Noise-sensitive land uses include, but are not necessarily limited to residential areas, hospitals, nursing facilities, intermediate care facilities, educational facilities, libraries, museums, places of worship, child care facilities, and certain types of passive recreational parks and open space.

City of San Diego Noise Ordinance

The City of San Diego Noise Ordinance—Chapter 5, Article 9.5, Division 4 of the City of San Diego Municipal Code—establishes prohibitions for disturbing, excessive, or offensive noise and contains provisions (e.g., sound level limits) for the purpose of securing and promoting public health, comfort, safety, peace, and quiet. Limits, as specified by land use, are provided in Table 4.12-2: City of San Diego Noise Limits. When two adjacent properties each have different zone classifications, the average of the two sound level limits is used. The Noise Ordinance prohibits the creation of any noise that exceeds the applicable limits of the Noise Ordinance at any point on or beyond the boundaries of the property on which the sound is produced. Fixed-location public utility distribution or power line facilities located on or adjacent to a property line are subject to these noise level limits, measured at or beyond six feet from the boundary of the property upon which the equipment is located.

Table 4.12-2: City of San Diego Noise Limits

Land Use Zone	Time of Day	One-Hour Average Sound Level (dB)
Single-Family Residential	7:00 a.m. to 7:00 p.m.	50
	7:00 p.m. to 10:00 p.m.	45
	10:00 p.m. to 7:00 a.m.	40
Multi-Family Residential (Up to a maximum density of ½,000)	7:00 a.m. to 7:00 p.m.	45
	7:00 p.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	55
All Other Residential	7:00 a.m. to 7 p.m.	50
	7:00 p.m. to 10:00 p.m.	55
	10:00 p.m. to 7:00 a.m.	60
Commercial	7:00 a.m. to 7:00 p.m.	65
	10:00 p.m. to 7:00 a.m.	60
	7:00 p.m. to 10:00 p.m.	60
Industrial or Agricultural	Any time	75

Source: City of San Diego, 2010

Construction is not allowed as follows:

- between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day,
- on legal holidays as specified in Section 21.04 of the City of San Diego Municipal Code, or
- on Sundays.

A permit can be obtained from the Noise Abatement and Control Administrator if construction activities must be conducted outside of these previously listed timeframes. In addition, it is prohibited to conduct any construction activity that results in an average sound level of 75 dB or greater during the 12-hour period between 7:00 a.m. and 7:00 p.m. at or beyond the property lines of any property zoned residential. Emergency work is exempted from the construction noise limits.

Existing Noise Measurements

The sound levels in most communities fluctuate, depending on the activity of nearby and distant noise sources, time of the day, or season of the year. Within an hour, the sound level can fluctuate between the lowest level (L_{min}) and the highest level (L_{max}). In order to quantify existing ambient and operational noise levels, noise monitoring was conducted at the northwest corner of the proposed Vine Substation site during a 25-hour period starting on February 25,

2014 and concluding on February 26, 2014. The monitoring period did not include any seasonal abnormalities; therefore, it is considered to be representative of a typical day at the Proposed Project site. The CNEL at this location was 73 dBA and the L_{eq} ranged between 66 dBA and 72 dBA and averaged 69 dBA. Attachment 4.12–A: Noise Technical Report provides a more detailed description of the noise measurement results.

Existing Noise Sources

The dominant ambient noise sources in the Proposed Project area are transportation-related. One of these sources is aircraft traffic from San Diego International Airport. The Proposed Project is located approximately 750 feet outside of the airport's CNEL 65 dB contour. Additional sources include heavy on-road traffic from Interstate (I-) 5, Kettner Boulevard, and Pacific Highway, and rail traffic from the Amtrak, North County Transit District Coaster and San Diego Metropolitan Transit System Trolley railroad tracks account for a significant portion of the existing ambient noise.

4.12.3 Impacts

Significance Criteria

Noise

Standards of significance were derived from Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Impacts to noise would be considered significant if the Proposed Project:

- Results in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies
- Results in exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels
- Results in a substantial permanent increase in ambient noise levels in the Proposed Project vicinity above levels existing without the Proposed Project
- Results in a substantial temporary or periodic increase in ambient noise levels in the Proposed Project vicinity above levels existing without the Proposed Project
- Lies within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, and, as a result, exposes people residing or working in the Proposed Project area to excessive noise levels
- Lies in the vicinity of a private airstrip and, as a result, exposes people residing or working in the Proposed Project area to excessive noise levels

The construction and operational noise thresholds of significance for the Proposed Project components have been derived from the applicable regulatory documents as discussed previously

in Section 4.12.2 Existing Conditions. Specific significance criteria for construction, operation, and maintenance noise levels are presented in the subsections that follow.

Construction

The following thresholds of significance for temporary or periodic increases and from construction noise have been developed for the Proposed Project-related L_{eq} values at noise-sensitive receptor locations:

- less than 75 dBA when measured at the receiving property line will be considered noticeable, but not significant, and
- 75 dBA and above when measured at the receiving property line will be considered significantly impacted.

Operation and Maintenance

The following thresholds of significance for operational noise have been developed for Proposed Project-related ambient noise increases:

- Less than three dB will be considered not discernible and not significant.
- Between three dB and five dB will be considered noticeable, but not significant if noise levels remain below the City of San Diego's Noise Standards of 75 dBA at six feet from the property.
- Three dB or greater will be considered significant if the noise increase will meet or exceed the City of San Diego's Noise Standards of 75 dBA at six feet from the property.
- Increases that exceed the City of San Diego's Noise Standards of 75 dBA at six feet from the property will be considered significant.

Vibration

Vibration amplitude decreases with distance from the source, as presented in Figure 4.12-1: Construction Vibration Amplitudes. Perceptibility of vibrations from construction equipment can be estimated by comparing the vibration thresholds provided in Table 4.12-1: Human Response to Transient Vibration to Figure 4.12-1: Construction Vibration Amplitudes. Vibration amplitudes with a PPV above 0.035 inch/second will be considered potentially significant. This amplitude corresponds with a distance of approximately 50 feet from construction activities.

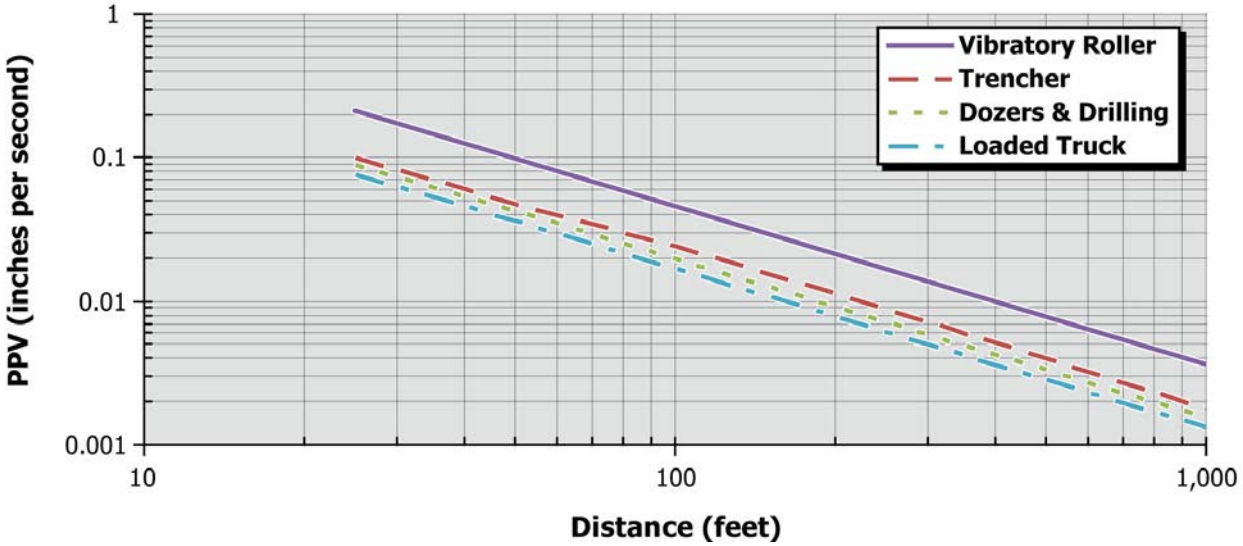
Question 4.12a – Noise in Excess of Standards

Construction – Less-than-Significant Impact

Construction of all of the Proposed Project components will require the temporary use of various types of noise-generating equipment, including graders, back hoes, augers, flatbed boom trucks, rigging and mechanic trucks, air compressors and generators, mobile cranes, concrete trucks, and man lifts. Wire-stringing operations will require pullers, tensioners, and cable reel trailers. Heavy equipment will be used to install substation components. Typical noise levels from construction equipment are provided in Table 4.12-3: Noise Levels Generated by Typical Construction Equipment. As demonstrated by Table 4.12-3: Noise Levels Generated by Typical

Construction Equipment, noise levels from this equipment during construction will typically range from 75 to 89 dBA when measured at a reference distance of 50 feet.

Figure 4.12-1: Construction Vibration Amplitudes



As described in Attachment 4.12–A: Noise Technical Report, the construction schedule and equipment list from Chapter 3 – Project Description was used to simulate the anticipated 12-hour average noise levels from construction. The maximum 12-hour average noise level on site will be approximately 91 dBA, which will occur while both site development and grading activities and boundary wall construction are occurring at the proposed Vine Substation. The nearest noise-sensitive receptors to the proposed Vine Substation are residences located on the east side of I-5, approximately 450 feet from construction activities. Considering the distance to these receptors and the attenuation provided by I-5, noise levels at these residences are anticipated to be approximately 35 dBA below the noise levels at the proposed Vine Substation. As a result, during the period of peak construction, noise levels at the nearest residence will be approximately 56 dBA. As a result, construction-related noise levels will be below the 75 dBA threshold for sensitive receptors under the City of San Diego's Noise Ordinance.

As described in Section 3.6.5 Construction Schedule, construction activities will typically occur during normal work hours from Monday through Saturday. Due to the potential traffic impacts related to open trenching within Kettner Boulevard, construction of portions of the distribution relocation and telecommunication facility extension will occur during the evenings. In addition, some concrete pours may take place during an extended day, depending on the size of the pour. Transformer oil filling may also require continuous work through the night. Actual cutovers of the circuits to the substation will be scheduled in a manner that maintains uninterrupted service to customers, which may require work to be done after normal business hours or on the weekend and/or nights. As a ordinary construction restriction, SDG&E will meet and confer with the City of San Diego, as needed, regarding activities that will be conducted outside of the hours permitted by the Noise Ordinance.

Table 4.12-3: Noise Levels Generated by Typical Construction Equipment

Equipment	Noise Level Range at Approximately 50 Feet (dBA)
Earth-Moving	
Front loader	79 to 80
Back hoe	78 to 80
Tractor, dozer	82 to 85
Scraper, grader	84 to 85
Paver	77 to 85
Truck	74 to 84
Materials-Handling	
Concrete mixer truck	79 to 85
Concrete pump	81 to 82
Crane (movable)	81 to 85
Stationary	
Pump	77 to 81
Generator	70 to 82
Compressor	78 to 80
Impact	
Jackhammers and rock drills	81 to 89
Compactors	80 to 83

Source: The Federal Highway Administration (FHWA), 2006

Because construction-related noise levels will be below the applicable thresholds during day-time work and all nighttime work will be coordinated with the City of San Diego, impacts will be less than significant.

Operation and Maintenance – Less-than-Significant Impact

Vine 69/12 kV Substation

The primary noise sources associated with the operation of the proposed Vine Substation will be from the four 69/12 kV transformers, and the cooling systems associated with the four pieces of 12 kV switchgear and the control shelter. As described in Attachment 4.12–A: Noise Technical Report, the operational noise anticipated from the proposed Vine Substation's ultimate arrangement was simulated. The maximum operational noise at the substation wall will be approximately 46.6 dBA, which will be well below the City of San Diego's standard of 75 dBA at a distance of six feet from the property line. As a result, operational noise emissions from the proposed Vine Substation will be consistent with applicable standards and will be less than significant.

The proposed Vine Substation will be unstaffed and electric equipment within the substation will be controlled from SDG&E's central operations facilities. Entry to an operational substation is restricted to authorized personnel only. Routine maintenance is expected to require approximately six trips per year by a two- to four-person crew. Equipment used to support this effort will include a crew truck, hydraulic tools, oil filtration equipment and a boom truck. Routine operations will require one or two workers in a light utility truck to visit the substation on a daily or weekly basis. It is anticipated that one annual major maintenance inspection will occur, requiring an estimated 10 personnel. It is anticipated that this inspection will take approximately one week or less to complete using a crew truck, hydraulic tools, oil filtration equipment, and a boom truck. Noise generated as the result of the previously described activities will be masked by the existing transportation sources in the area including air traffic from San Diego International Airport, rail traffic from the adjacent railroad tracks, and vehicular traffic from adjacent roadways including I-5 and Kettner Boulevard. In addition, the proposed maintenance activities will be similar to those being performed at the existing Kettner Substation, which is located approximately 2,300 feet southeast of the Proposed Project site. As a result, there will be no exceedance of established noise standards due to maintenance of the substation, and there will be no impact.

12 kV Distribution Relocation

The relocated distribution circuits will be installed entirely underground; therefore, they will not generate any operational noise. Maintenance—which may include replacement of damaged cables or connectors—will be conducted by crews of four to six personnel and will require a tool truck, cable truck, assist truck, and/or trouble shooter truck. Routine inspections will occur annually to identify connection problems or to inspect for equipment degradation. Because SDG&E operates existing distribution facilities in the vicinity of the relocated circuits, noise from operation and maintenance activities will be consistent with the activities that are currently conducted in the area. As a result, there will be no impact.

69 kV Loop-In

When a power line is in operation, an electric field is generated in the air surrounding the conductors, forming a "corona." The corona results from the partial breakdown of the electrical insulating properties of air surrounding the conductors. When the intensity of an electric field at the surface of the conductor exceeds the insulating strength of the surrounding air, a corona discharge occurs at the conductor surface, representing a small dissipation of heat and energy.

Some of the energy may dissipate in the form of small local pressure changes that create audible noise. Audible noise generated by corona discharge is characterized as a hissing or crackling sound that may be accompanied by a 120 Hz hum. Slight irregularities or water droplets on the conductor and/or insulator surface accentuate the electric field strength near the conductor surface, thereby making corona discharge and the associated audible noise more likely. Therefore, audible noise from power lines is generally a foul weather (i.e., wet conductor) phenomenon. However, during fair weather, insects and dust on the conductors can also serve as sources of corona discharge.

Following the construction of the 69 kV loop-in, overhead conductors will continue to parallel and cross the existing railroad tracks located adjacent to the proposed Vine Substation. Because the loop-in will continue to be operated at 69 kV and the conductors will be placed in the same general location, the anticipated corona noise from these conductors will not change from existing conditions. As a result, there will be no impact from corona noise.

It is anticipated that the 69 kV loop-in will be inspected once per year. In a non-emergency situation, major maintenance may include the replacement of damaged insulators or other equipment. Maintenance crews, consisting of as many as four people, may require a tool truck, an assist vehicle, and a large bucket truck. Insulators may require washing up to three times a year to prevent flashovers, equipment damage, and outages. SDG&E currently operates and maintains power line facilities in the vicinity of the 69 kV loop-in. Following construction, these activities will not change; therefore, no impact will occur.

Telecommunication System Extension

The proposed overhead fiber optic cable that will be installed within the same alignment as the 69 kV loop-in will not generate any operational noise. The remainder of the fiber optic cable will be installed underground; therefore, these portions of the cable will not generate operational noise. Routine maintenance is not typically conducted for these facilities. Because the fiber optic cable will not generate any noise and no maintenance activities are required, there will be no impact.

Question 4.12b – Groundborne Vibration and Noise

Construction – No Impact

Construction activities can generate varying degrees of ground-borne vibration, depending on the construction procedure and the construction equipment used. Operating construction equipment generates vibrations that spread through the ground and diminish in amplitude with distance from the source. The effect on buildings located in the vicinity of the construction site often varies depending on soil type, ground strata, and construction characteristics of the receiving

buildings. Table 4.12-1: Human Response to Transient Vibration states that vibrations become perceptible by humans at an amplitude of approximately 0.035 inch per second. When compared to Figure 4.12-1: Construction Vibration Amplitudes, a PPV of 0.035 inch per second is generated at a distance of approximately 50 feet by a loaded truck. Because there are no sensitive receptors located within 50 feet of the Proposed Project, construction activities will not generate perceivable levels of ground-borne vibration. As a result, there will be no impact.

Operation and Maintenance – Less-than-Significant Impact

Operation of the Proposed Project will consist of routine maintenance activities and emergency repairs. It is unlikely that these activities will produce significant groundborne vibrations because operation and maintenance activities will not require significant ground-disturbing activities. Operation of transformers at the proposed Vine Substation could produce groundborne vibration; however, groundborne vibrations will be perceptible only in the immediate transformer pad vicinity (i.e., less than 25 feet), if at all This will not be perceptible at the property line, much less to sensitive receptors outside of the site. No other component of the Proposed Project will generate vibrations during operation. Therefore, impacts will be less than significant.

Question 4.12c – Substantial Permanent Ambient Noise Increases

Construction – No Impact

Construction activities will occur over a finite period; therefore, no permanent increase in noise will occur and there will be no impact.

Operation and Maintenance – Less-than-Significant Impact

As described in the response to Question 4.12a, the primary source of operational noise at the proposed Vine Substation will be its transformers, the cooling systems associated with the switchgear and control shelter. Attachment 4.12–A: Noise Technical Report presents the simulated noise contours resulting from the operation of the substation. The maximum operational noise at the substation wall will be approximately 46.6 dBA, which will be well below the City of San Diego's standard of 75 dBA at a distance of six feet from the property line. As a result, operational noise emissions from the proposed Vine Substation will be consistent with applicable standards. With the exception of the 69 kV loop-in, the remaining Proposed Project components will be installed underground, within enclosures, or will not generate any perceptible noise during operation. As a result, these components will not act as permanent ambient noise sources. As described in response to Question 4.12a, the 69 kV loop-in will be installed in the vicinity of the existing Tie-Line 604 and the corona generated by the loop-in will be similar to what is currently being generated by the existing power line conductors in the area. As a result, there will be no new source of permanent ambient noise and no change in the existing operational noise in the area. As a result, impacts will be less than significant.

Question 4.12d – Substantial Temporary or Periodic Ambient Noise Level Increases

Construction – Less-than-Significant Impact

Construction noise will be temporary and impacts during construction are identified in the response to Question 4.12a. Noise-sensitive receptors will not experience a significant increase

in ambient noise during construction activities, as previously described. Impacts will be less than significant due to the short-term nature of the construction phase of the Proposed Project, the existing transportation-related ambient noise sources in the area, the generally industrial setting of the area and the distance between the site and sensitive receptors.

Operation and Maintenance – No Impact

As discussed previously in the response to Question 4.12a, the maintenance activities conducted for the Proposed Project will result in less-than-significant temporary and periodic increases in ambient noise levels due to the operation of crew trucks and heavy equipment. As described previously, the closest sensitive noise receptors to the Proposed Project are located approximately 450 feet to the east. I-5 serves as a major interstate in the area, and is located between these sensitive receptors and the Proposed Project. As a result, the periodic increases in ambient noise from construction vehicles will be masked by the significant amount of traffic noise from vehicles that travel along I-5. In addition, SDG&E already performs similar maintenance activities in the Proposed Project area that will not change following construction. Therefore, there will be no impact.

Question 4.12e – Air Traffic Noise from Public Airports – *Less-than-Significant Impact*

The Proposed Project site is located approximately one mile from San Diego International Airport and is within the area covered by the Airport Land Use Compatibility Plan (ALUCP). The noise compatibility policies and standards in the ALUCP are designed to avoid the establishment of new noise-sensitive land uses—including residences, public and private schools, hospitals and convalescent homes, and places of worship—within the CNEL 65 dB contour. While the proposed Vine Substation is located adjacent to the CNEL 65 dB contour, the substation will not be considered an incompatible land use. As a result, the Proposed Project will not expose workers in the Proposed Project area to excessive noise levels, and impacts will be less than significant.

Question 4.12f – Air Traffic Noise from Private Airstrips – *No Impact*

There are no private airstrips located within two miles of the Proposed Project. Therefore, people working in the Proposed Project area during the construction, operation, or maintenance phases will not be exposed to excessive noise levels attributable to a private airstrip, and no impact will occur.

4.12.4 Applicant-Proposed Measures

Because the Proposed Project will have a less-than-significant impact with regard to noise, no applicant-proposed measures are proposed.

Subject: Vine 69/12 Kilovolt Substation Project (Proposed Project) Noise Analysis
Acentech Job No. 624025

Dear Rob:

INTRODUCTION

Project Location & Description

The proposed Vine Substation site is located at the southwest corner of Vine Street and Kettner Boulevard in the City of San Diego.

The 69/12 kV substation will include four transformers and four switchgear units.

APPLICABLE NOISE REGULATIONS & STANDARDS

Federal

There are no federal noise standards that directly regulate environmental noise related to the construction or operation of a project of this type. However, the United States (U.S.) Environmental Protection Agency (EPA) has established guidelines for noise levels below which there is no reason to suspect that the general population will be at risk from any of the identified effects of noise. These levels are not standards, criteria, regulations, or goals, but are defined to protect public health and welfare with an adequate margin of safety, and to provide guidelines for implementing noise standards locally. As a guideline, the EPA identified a day-night average sound level (Ldn) value of 55 A-weighted decibels[1] (dBA) as the threshold of activity interference outside farm residences.

In addition, the federal government has passed various laws to regulate and limit noise levels in the U.S., a discussion of which follows.

[1] The human ear is not uniformly sensitive to all sound frequencies; therefore, the A-weighting scale has been devised to correspond with the human ear's sensitivity. The A-weighting scale uses the specific weighting of sound pressure levels from about 31.5 hertz (Hz) to 16 kilohertz (kHz) for determining the human response to sound.

Noise Pollution and Abatement Act of 1970

The Noise Pollution and Abatement Act of 1970 established the Office of Noise Abatement and Control within the EPA, and requires investigations of noise issues and consultation with the EPA.

Noise Control Act of 1972

The Noise Control Act of 1972 was the first comprehensive statement of national noise policy. It declared "it is the policy of the U.S. to promote an environment for all Americans free from noise that jeopardizes their health or welfare."

Occupational Health and Safety Act (OSHA) of 1970

The OSHA regulates worker noise exposure to 90 dBA over an eight-hour work shift. Areas where exposure exceeds 85 dBA must be designated and labeled as high-noise-level areas where hearing protection is required.

Federal Aviation Administration (FAA)

The FAA establishes 65 decibels (dB) Community Noise Level Equivalent[2] (CNEL) as the noise standard associated with aircraft noise measured at exterior locations in noise sensitive land uses such as a residence.

State

There are also no regulations at the state level that would apply to noise from substation operation. However, there are state guidelines and standards on noise.

California Noise Control Act

The California Noise Control Act states that excessive noise is a serious hazard to the public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. It also finds that there is a continuous and increasing bombardment of noise in the urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the state to provide an environment for all Californians free from noise that jeopardizes their health or welfare.

California has adopted the California Environmental Quality Act (CEQA) to assess the potential for significant noise impacts as a result of projects. CEQA requires that the following questions be asked:[3]

- Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local General Plan or Noise Ordinance or applicable standards of other agencies?
- Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

For purposes of the second question, CEQA does not define what noise level increase would be considered "substantial." However, in CEQA noise analysis, it is common to define a noise impact as

[2] CNEL measurements are weighted averages of sound levels gathered over a 24-hour period, essentially measuring ambient noise. Measurements taken during day, evening and nighttime periods are weighted separately, recognizing that humans are most sensitive to noise in late night hours and are more sensitive during evening hours than in daytime hours.

[3] This list represents a subset of questions that are asked as part of CEQA. Additional questions related to the analysis of potential impacts from noise are not addressed in this report.

significant if the pre-existing noise environment has an L_{dn} of 55 dBA or more and if a project would increase noise levels by more than 3 dB at noise-sensitive receptors.

California Noise Insulation Standards

The California Noise Insulation Standards were adopted in 1974 by the California Commission on Housing and Community Development to establish noise insulation standards for multi-family residential buildings. This document establishes standards for interior room noise attributable to outside noise sources. The regulations also specify that acoustical studies must be prepared whenever a residential building or structure is to be located near an existing or adopted freeway route, expressway, parkway, major street, thoroughfare, rail line, rapid transit line, or industrial noise source, and where such noise source or sources create an exterior CNEL (or Ldn) of 60 dB or greater. Such acoustical analysis must demonstrate that the residence has been designed to limit intruding noise to an interior CNEL (or Ldn) of at least 45 dB.

Local

The City of San Diego Noise Ordinance[4] defines noise and regulates it by land-use, and time of day as shown in Table 1. These standards represent the exterior noise level limits, as measured at the property boundary of receiving land use, which is used to determine noise impacts.

Table 1 City of San Diego Exterior Noise Limits

Land Use Zone	Time of Day	One-Hour Average Sound Level (dB)
1. Single Family Residential	7 a.m. to 7 p.m.	50
	7 p.m. to 10 p.m.	45
	10 p.m. to 7 a.m.	40
2. Multi-Family Residential (Up to a maximum density of 1/2000)	7 a.m. to 7 p.m.	45
	7 p.m. to 10 p.m.	50
	10 p.m. to 7 a.m.	55
3. All other Residential	7 a.m. to 7 p.m.	50
	7 p.m. to 10 p.m.	55
	10 p.m. to 7 a.m.	60
4. Commercial	7 a.m. to 7 p.m.	65
	10 p.m. to 7 a.m.	60
	7 p.m. to 10 p.m.	60
5. Industrial or Agricultural	Any time	75

[4] Article 9.5: Noise Abatement and Control Division 4: Limits ("Noise Level Limits, Standards and Control"§59.5.0401 Sound Level Limits)

Fixed–location public utility distribution or transmission facilities located on or adjacent to a property line are subject to these noise level limits, measured at or beyond six feet from the boundary of the easement upon which the equipment is located.

Construction is unlawful between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, or on legal holidays or on Sundays. A permit can be applied for and granted beforehand by the Noise Abatement and Control Administrator. It is also unlawful to conduct any construction activity so as to cause, at or beyond the property lines of any property zoned residential, an average sound level greater than 75 decibels during the 12–hour period from 7:00 a.m. to 7:00 p.m.

For noise – land use compatibility planning, the City of San Diego currently uses the 1979 General Plan Land Use-Noise Level Compatibility Standards. The City has an exterior noise level standard of 65 dB CNEL for noise-sensitive uses. These standards are designed to protect noise-sensitive land uses from high noise levels and to be used as guidelines in the planning for future land uses. Noise-sensitive land uses include, but are not necessarily limited to the following: residential, hospitals, nursing facilities, intermediate care facilities, educational facilities, libraries, museums, places of worship, child care facilities, and certain types of passive recreational parks and open space.

ENVIRONMENTAL SETTING

Setting & Location

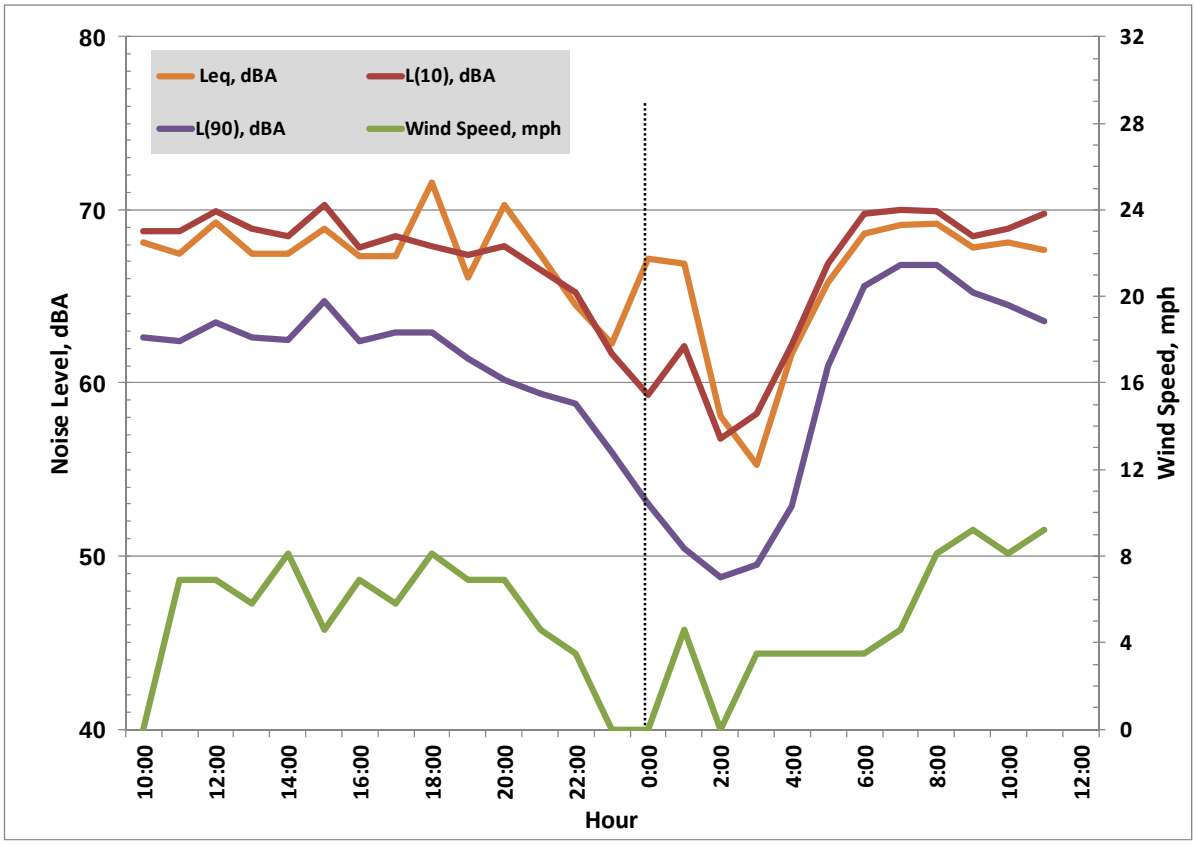
The existing noise environment at the Project site includes contributions from the following sources:

- San Diego Freeway (Interstate 5 [I-5])
- Pacific Highway
- Amtrak and Metrolink Trains
- San Diego International Airport
- Local Traffic on Kettner Boulevard

Existing Noise Conditions

The sound levels in most communities fluctuate depending upon the activity of nearby and distant noise sources, time of the day, or season of the year. Noise monitoring was performed at the northwest corner of the proposed Vine Substation site for 25 hours starting 25 February 2014 and ending 26 February 2014. The noise environment at the Project site is greatly influenced by local traffic on the nearby streets and I-5, rail traffic on the adjacent Los Angeles-San Diego-San Luis Obispo (LOSSAN) rail corridor, and airplanes arriving to and departing from San Diego International Airport. As a result, very little seasonal fluctuations are expected and the noise data are considered representative of a typical day.. Figure 1 presents the ambient noise measurement results and the wind speeds occurring during the monitoring period. The CNEL at this location was 73 dBA and the daytime hourly equivalent noise level (Leq) ranged between 66 dBA and 72 dBA and averaged 69 dBA.

Figure 1 Ambient Noise Levels at the Proposed Vine Street Substation



The noise contribution to the local noise environment from aircraft activities related to San Diego International Airport is indicated by the following figure published by the San Diego International Airport that shows the CNEL contour for the airport activities. The Proposed Project is located outside of San Diego International Airport's CNEL 65 dBA Contour.

THRESHOLDS OF SIGNIFICANCE

The level of significance evaluation in this study is based on CEQA guidelines, the Federal, State and local noise standards. The significance criteria that follow were established from the laws, ordinances, regulations and standards applicable to the Proposed Project area. Separate noise significance criteria were developed for the construction and operation and maintenance phases of the project.

Human Perception of Noise Level Change

Under controlled conditions, in an acoustics laboratory, the trained healthy human ear is able to discern changes in sound levels of one dB, when exposed to steady, single frequency "pure tone" signals in the mid-frequency range. Outside of such controlled conditions, the trained ear can detect changes of two dB in normal environmental noise. It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of three dB. A five dB increase is readily noticeable, while the human ear perceives a 10 dB increase as a doubling of sound.

In general, any noise that exceeds the local jurisdiction's adopted standards will be considered potentially significant. Specific criteria for construction and operation noise levels follow.

Construction

Given the baseline background noise environment, the following thresholds of significance for temporary or periodic increases and from construction noise have been developed for the Proposed Project-related average daytime Leq values at noise sensitive receptor locations:

- Less than 75 dBA when measured at a residential property line will be considered noticeable, but not significant,
- 75 dBA and above when measured at a residential property line will be considered significantly impacted.

Operation and Maintenance

Based on the above discussion, the following thresholds of significance for operational noise have been developed for Proposed Project-related increases:

- Less than three dB will be considered not discernible and not significant.
- Between three dB and five dB will be considered noticeable, but not significant, if noise levels remain below the City of San Diego's Noise Standards of 75 dBA at 6 feet from the property.
- Three dB or greater will be considered significant if the noise increase will meet or exceed the City of San Diego's Noise Standards of 75 dBA at six feet from the property easement.
- Increases that exceed the City of San Diego's Noise Standards of 75 dBA at six feet from the property easement will be considered significant.

Construction Noise Impacts

The noise from construction will be a composite of many concurrent construction activities as indicated in Figure 2 Construction Schedule and Average Leq(day). At the bottom of Figure 2, the noise emissions were summed.

The nearest residence is located on the east side of the I-5 freeway, approximately 460 feet from the center of the substation. Considering distance and the shielding provided by the freeway the construction noise will be approximately 35 decibels below the values presented in Figure 2. During the month with the highest construction noise the noise levels resulting in the nearest residence would be 56 dBA and the noise impacts will be less than significant.

Figure 2 Construction Schedule and Average Leq(day)

Operations and Maintenance – Noise Impact

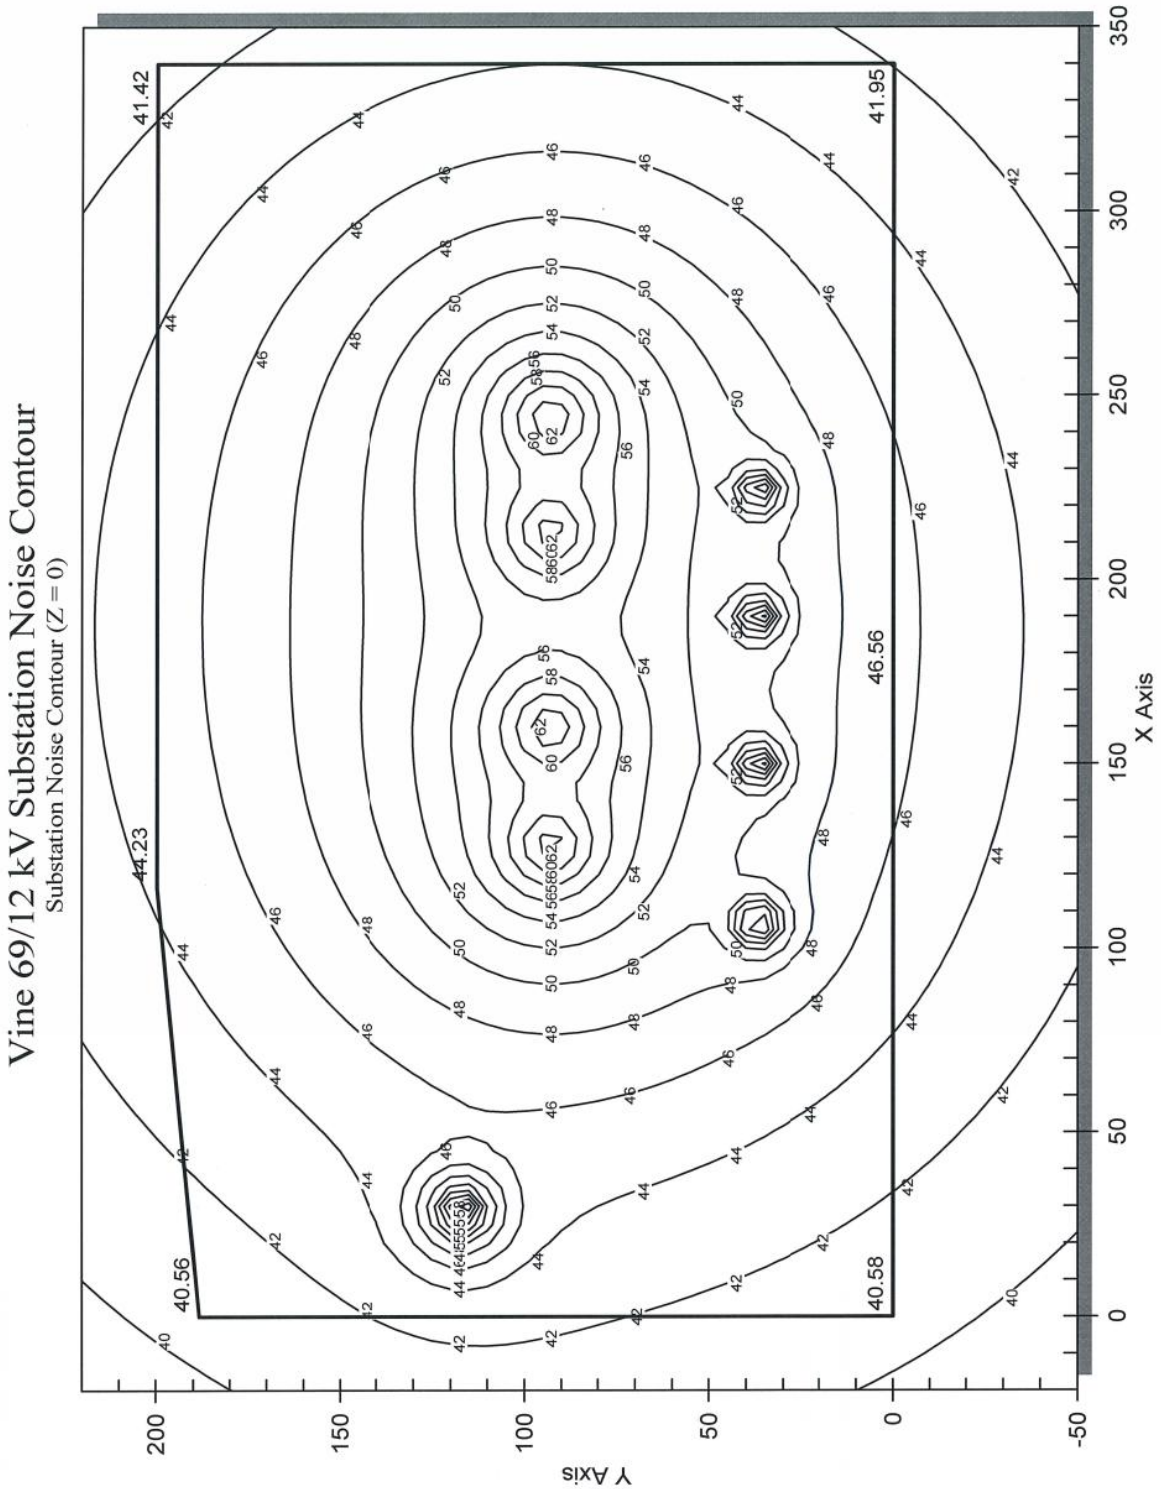
The calculated L_{eq} noise contours (lines of equal sound level) are depicted in Figure 3 Vine Substation Operational Noise Levels. The Contours were developed by San Diego Gas & Electric Company using the following noise-generating equipment and associated noise levels:

- Four 69/12 kV transformers – 61 dBA at 5 feet
- One heating, ventilation, and air conditioning (HVAC) unit for the control shelter – 70 dBA at 5 feet
- Four HVAC units for switchgear – 70 dBA at 5 feet

The noise contour modeling did not consider the effect of the perimeter wall which will reduce the noise levels at a distance of six feet from the property easement by between 5 and 10 dB.

The substation noise levels at six feet from the property are less than 75 dBA; therefore, the impact will be considered less than significant.

Figure 3 Vine Substation Operational Noise Levels



CONCLUSIONS

Acentech Inc. has completed an acoustical analysis for the Proposed Project. The impact assessment in this report has been made in relation to the City of San Diego's General Plan requirements and regulations and CEQA Guidelines.

The results of our analysis indicate that construction and operation noise impacts will be less than significant.

Sincerely yours,

ACENTECH INCORPORATED

Ramon E. Nugent, P.E. (TX)
Director

4.13 POPULATION AND HOUSING

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?				✓
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				✓
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				✓

4.13.0 Introduction

This section identifies existing population and housing trends in the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project). The Proposed Project site is located within a highly urbanized area in the City of San Diego, in the Midway/Pacific Highway Corridor Community Plan area. The Proposed Project is intended to accommodate existing and planned growth in the downtown and surrounding area; meet the area's electric capacity needs; and provide improved substation and circuit reliability with added tie capacity. The Proposed Project will not extend service into new areas and, therefore, will not have a significant impact on the local or regional population by inducing growth. In addition, the Proposed Project will not require the displacement of housing or people. As such, no impacts will occur with regard to population and housing.

4.13.1 Methodology

Data used to conduct demographic and economic analyses were obtained primarily from statistical reports published by the United States (U.S.) Census Bureau and the California Employment Development Department (EDD). A literature search was also conducted and included City of San Diego publications and government websites, such as the San Diego Association of Governments (SANDAG) website.

4.13.2 Existing Conditions

The regulatory requirements and overall existing population and housing conditions of the Proposed Project are described in the following subsections.

Population

Table 4.13-1: Population Totals and Trends identifies population totals and trends within the City of San Diego and Midway/Pacific Highway Corridor Community Plan area. In the year 2010, the City of San Diego had an estimated population of 1,301,617 residents, or approximately 42 percent of the 3,095,313 total population of the County of San Diego and approximately 3.5 percent of the 37,253,956 total population of the State of California. In 2010, the Midway/Pacific Highway Corridor Community Plan area had a population of 4,628, representing approximately 0.3 percent of the total population of the City of San Diego. Population within the City of San Diego continues to grow, as demonstrated by an approximate six-percent increase in population between 2000 and 2010.

Table 4.13-1: Population Totals and Trends

Jurisdiction	2000 Census Total	2010 Census Total	Percentage Change Between 2000 and 2010	Projected Population for 2020
City of San Diego	1,223,400	1,301,617	6	1,542,324
Midway/Pacific Highway Corridor Community Planning area	4,660	4,628	-1	4,398

Source: SANDAG, October 2011

Housing

Table 4.13-2: Housing Units and Vacancy Rates identifies data for the County of San Diego and the City of San Diego with regard to the number of housing units and associated vacancy rates. In 2010, the U.S. Census Bureau estimated that the County of San Diego had 1,164,786 housing units with a vacancy rate of 6.7 percent. In 2010, the City of San Diego had an estimated 516,033 housing units with a vacancy rate of 6.4 percent. In 2010, the Midway/Pacific Highway Corridor Community Planning area had 1,851 housing units.

Table 4.13-2: Housing Units and Vacancy Rates

County/City	Total Housing Units	Percentage of Vacant Units
County of San Diego	1,164,786	6.7
City of San Diego	516,033	6.4

Source: U.S. Census Bureau

For 2011, approximately 51.7 percent of the total housing units in the County of San Diego were detached, single-family homes. According to the U.S. Census Bureau, approximately 45.8 percent of the 516,033 housing units in the City of San Diego were also estimated as detached, single-family homes for the same year.

Temporary Housing

The Proposed Project area is located near various visitor accommodations. In 2012, the San Diego Convention and Visitors Bureau reported approximately 461 hotel and motel properties with over 56,000 rooms available to visitors within the County of San Diego. The total average occupancy rate for these lodging establishments was approximately 70.7 percent.

Employment and Income

Table 4.13-3: Employment Figures and Unemployment Range identifies the total employment and unemployment rates for the Proposed Project area. In October 2013, the unemployment rate for the County of San Diego was seven percent, and approximately 112,700 people in the total available labor force of 1,598,900 were unemployed. The City of San Diego had the same unemployment rate of seven percent for October 2013, with approximately 50,300 people in the labor force unemployed.

Table 4.13-3: Employment Figures and Unemployment Range

County/City	Total Employed	Total Unemployed	Unemployment Rate (Percent)
County of San Diego	1,598,900	112,700	7.0
City of San Diego	663,500	50,300	7.0

Source: California EDD, October 2013

According to U.S. Census Bureau data, the median annual household income for the County of San Diego was estimated at $63,857 for 2007 to 2011. For the City of San Diego, the median annual household income was estimated at $63,739 for 2007 to 2011. In 2010, the median household income in the Midway/Pacific Highway Corridor Community Plan area was $39,684.

4.13.3 Impacts

Significance Criteria

Determination of impacts was derived from Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Impacts to population and/or housing would be considered significant if the Proposed Project:

- Induces substantial population growth
- Displaces a substantial number of housing units
- Displaces a substantial number of people

Question 4.13a – Population Growth

Construction – No Impact

It is anticipated that most of the construction workers for the Proposed Project will reside within the County of San Diego, outside the immediate vicinity of the Proposed Project. It is not anticipated that workers will need to reside temporarily at local lodging establishments. Due to the scope of the Proposed Project, construction is not expected to increase the desirability or

affordability of the area, or cause a significant increase in permanent population within the local community or otherwise. As a result, no impact to population growth from construction of the Proposed Project will occur.

Operation and Maintenance – No Impact

Following construction of the Proposed Project, no permanent jobs are expected to be created in the vicinity of the Proposed Project. When in operation, the substation will be unstaffed and remotely operated. One to two workers will visit the substation site on a daily or weekly basis, but the substation will not require dedicated, full-time personnel. Routine maintenance of the substation is expected to require approximately six trips a year by a two- to four-person crew. It is also anticipated that one major maintenance inspection will occur annually, requiring an estimated 10 personnel and approximately one week to complete. SDG&E anticipates that these needs can be met by its existing staff.

The Proposed Project is being built to meet the electrical needs of the area and, therefore, will not induce population growth in the area either directly or indirectly. In addition, long-term operation and maintenance activities for the Proposed Project will not result in the demand for new residential units and will not significantly increase the desirability or affordability of the surrounding area. Similarly, it will not create new opportunities for local industry or commerce or impact population growth in the area. As a result, the Proposed Project is not expected to cause a direct or indirect increase in population growth. As such, no impacts to population growth will occur as a result of operation and maintenance of the Proposed Project.

Question 4.13b – Displacement of Existing Housing

Construction – No Impact

Construction will occur within public right-of-ways (ROWs) and within an unpopulated parcel owned by SDG&E, which is currently being leased for long-term parking. New ROWs will be secured by SDG&E for the distribution relocation, construction of the 69 kV loop-in, and telecommunication system upgrade work. There are no housing units within the proposed new ROW locations or within the proposed Vine Substation parcel.

The proposed staging areas will be located within the proposed Vine Substation site and at existing SDG&E facilities, as described in Section 3.6.0 Staging Areas in Chapter 3 – Project Description. All temporary work areas will be located immediately adjacent to the Proposed Project components within city streets, public areas, and the proposed Vine Substation site. There are no housing units within the proposed temporary work areas. Therefore, existing housing will not be displaced by the staging and temporary work areas and no impact will occur during construction of the Proposed Project.

Operation and Maintenance – No Impact

Operation and maintenance of the proposed facilities will include regular inspection, repair work, and vegetation trimming, as needed. These activities currently occur for the existing SDG&E facilities in the area and will generally remain the same for the proposed Vine Substation and associated components. As there are no housing units located on the proposed substation site or within the proposed ROWs, regular operation and maintenance practices required for the

proposed facilities will not displace any existing housing. Therefore, there will be no impact from operation and maintenance of the Proposed Project.

Question 4.13c – Displacement of People – *No Impact*

The Proposed Project will be constructed, operated, and maintained within a highly developed area within the City of San Diego where surrounding lands generally support light- and medium-industrial and office uses, parking lots, and rental car facilities, with limited residential uses. The proposed Vine Substation site is located on an SDG&E-owned parcel that is presently used as a long-term airport parking lot. All other Proposed Project components will be constructed on lands owned by SDG&E or within public ROWs. Therefore, construction, operation, and/or maintenance of all components of the Proposed Project will not displace any existing housing units, as discussed previously in the response to Question 4.13b. As such, no one will be displaced with implementation of the Proposed Project. Therefore, there will be no impact from construction, operation, or maintenance of the Proposed Project.

4.13.4 Applicant-Proposed Measures

Because the Proposed Project will have no impact on population and housing, no applicant-proposed measures are proposed.

Other public facilities?				✓

4.14.0 Introduction

The section describes local public services in the area of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) and evaluates potential effects on existing services. Fire and emergency services, police and protective services, hospitals, schools, parks, and other public services are addressed, and the potential effects resulting from construction, operation, and maintenance are evaluated. Through this analysis, it was determined that the Proposed Project will have no impacts on public services.

4.14.1 Methodology

Research regarding fire, police, emergency services, and public libraries involved the review of data from the City of San Diego. Data pertaining to local area schools were obtained from the San Diego Unified School District. Statistics pertaining to local hospitals and recreational amenities were also obtained through additional desktop-level research, utilizing online sources.

4.14.2 Existing Conditions

The regulatory requirements and overall existing public services conditions of the Proposed Project are described in the following subsections.

Fire and Emergency Services

Serving the eighth-largest city in the United States and the second-largest city in California, the San Diego Fire-Rescue Department (SDFD) provides City of San Diego residents with fire and life-saving services, including fire protection, emergency medical services, and lifeguard protection at San Diego beaches. The SDFD serves a population of approximately 1,337,000 and a service area of approximately 331 square miles. The SDFD operates 47 stations with approximately 801 uniformed personnel and 161 civilian personnel.

The Proposed Project will be served by Fire Station 3, located at 725 West Kalmia Street, approximately 0.8 mile southeast of the Proposed Project site. The station provides both fire protection and medical/rescue services. In addition, the Airport Station at San Diego International Airport, located at 3698 Pacific Highway, is approximately 0.5 mile southwest of the Proposed Project site.

Police Protection Services

The City of San Diego Police Department serves the Proposed Project area. The main headquarters are located at 1401 Broadway in downtown San Diego, approximately 2.3 miles southeast of the Proposed Project site. In addition to police protection services, the police department operates a number of specialized divisions that include the domestic violence, financial crimes, forensic science, and traffic units.

The Proposed Project site is served by the police department's Western Division, which serves the communities of Hillcrest, La Playa, Linda Vista, Loma Portal, Midtown, Midway District, Mission Hills, Mission Valley West, Morena, Ocean Beach, Old Town, Point Loma Heights, Roseville-Fleetridge, Sunset Cliffs, University Heights, and Wooded Area. The Western Division is headquartered at 13396 Salmon River Road, approximately 2.1 miles to the northwest of the site, and serves a population of 129,709 people with a service area of approximately 22.7 square miles.

The Proposed Project site will be served by the Peninsula Storefront Station, located at 3750 Sports Arena Boulevard, Suite #3. The station is located approximately 2.4 miles northwest of the Proposed Project site.

Hospitals

The following are the two closest major medical facilities to the Proposed Project site:

- Scripps Mercy Hospital, located at 4077 Fifth Avenue, approximately 1.3 miles northeast of the site, and
- St. Pauls' Program of All-Inclusive Care for the Elderly, located at 111 Elm Street, approximately 1.3 miles southeast of the Proposed Project site.

Schools

The Proposed Project falls within the San Diego Unified School District. The following schools are within approximately one mile of the Proposed Project:

- Montessori School of San Diego, located approximately 0.25 mile southeast of the Proposed Project;
- Grant Elementary School, located approximately 0.7 mile north of the Proposed Project;
- Old Town Academy K-8 Charter School, located approximately 0.85 mile northeast of the Proposed Project;
- Saint Vincent de Paul School, located approximately 0.9 mile north of the Proposed Project;
- Fleur de Lis School, located approximately 0.95 mile northeast of the Proposed Project;
- Museum School, located approximately one mile southeast of the Proposed Project; and
- Florence Elementary School, located approximately one mile northeast of the Proposed Project.

Other Services

The closest public library is the Mission Hills Branch Library, located at 925 West Washington Street, approximately 0.82 mile northeast of the Proposed Project site. The Central Library is located at 330 Park Boulevard, approximately 2.55 miles to the southeast of the Proposed Project site. In addition, the San Diego County Library is located at 5555 Overland Avenue, approximately seven miles northeast of the Project site.

Many local, regional, county, and state parks are located in and around the City of San Diego. The parks nearest to the Proposed Project site include the following:

- Pioneer Park, located approximately 0.7 mile north of the Proposed Project;
- Mission Hills Park, located approximately 0.7 mile north of the Proposed Project;
- Beeson Field, located approximately 0.9 mile west of the Proposed Project;
- Maple Canyon Trail, located approximately 0.95 mile east of the Proposed Project;
- Beth Israel Park, located approximately one mile southeast of the Proposed Project; and
- Balboa Park, located approximately one mile east of the Proposed Project.

4.14.3 Impacts

Significance Criteria

Determination of impacts was derived from Appendix G of the California Environmental Quality Act Guidelines. Impacts to public services are considered potentially significant if they result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities—or the need for new or physically altered governmental facilities—in order to maintain acceptable service ratios, response times, or other performance objectives. These public services include fire and police protection, emergency services, hospitals, schools, and public facilities.

Question 4.14a – Adverse Impact to Public Services – *No Impact*

Construction – No Impact

The Proposed Project will be constructed within the City of San Diego. Up to 30 construction personnel are expected to be required to be on site during the various phases of construction. Construction of the proposed facilities will not likely to affect the use or operation of any public services or facilities within the immediate area, including fire or police protection services, emergency services, hospitals, schools, parks, or other services (i.e., libraries), because the crew members will likely commute from within the San Diego County area where they are already using such services. Moreoever, this small number of construction personnel represent an insignificant fraction of the region's existing population. It is not anticipated that workers will need to reside temporarily at local lodging establishments. In addition, the Proposed Project will not result in a permanent need for new or additional public services, because it will not directly induce population growth or result in the construction of residential or other land uses that will indirectly induce area population growth.

Fire and Police Protection

Several emergency providers are located in the vicinity of Proposed Project; however, none are located within approximately 0.25 mile. Therefore, construction of the proposed facilities will not directly interfere with fire and police protection or other emergency service providers in the immediate area. The Proposed Project will not result in an increase in the temporary demand for nor alter the level of local public services required, as it will not increase the population or demands for housing in the area. In addition, it will not materially increase the density of the nearby built environment. An emergency could arise as a result of Proposed Project construction, but such an incident is of low probability and will be well within the current capabilities of the existing emergency services. Construction is not anticipated to affect response times because no road closures will be required for construction activities. While lane closures will be necessary during construction, traffic controls will be implemented as required by the Encroachment Permit that will be obtained from the City of San Diego, and emergency vehicles will be provided access. As a result, no impacts to fire and police protective services are anticipated.

Schools

The Proposed Project will not increase the temporary demand for school enrollment because it will not perceptibly increase local population during construction. The majority of the construction crew is likely to be hired from the local operators union and local electrical workers union, which can provide the approximately 30 potential workers from the San Diego area; therefore, construction of the Proposed Project will not create a significant new workforce that will result in a new or increased demand for school services. Family relocation will not be necessary. No new hires will be required for operation and maintenance of the Proposed Project. Therefore, school enrollment will not be affected, and no new schools will be necessary as a result of the Proposed Project. As a result, no impacts to schools are expected.

Parks

No recreational facilities are found within 0.25 mile of the Proposed Project site. The nearest recreational facilities—Pioneer Park and Mission Hills Park—are located approximately 0.7 mile north of the Proposed Project and on the east side of Interstate (I-) 5. Construction of the Proposed Project will notincrease local population growth resulting in the need for new parks or park expansion, nor will it cause a reduction in the availability of recreational resources in the area, as none will be affected by the Proposed Project. Therefore, no impacts to parks or other recreational facilities will result.

Other Public Facilities

No other public facilities are located within 0.25 mile of the Proposed Project components. The closest public library, the Mission Hills Branch Library, is located approximately 0.82 mile northeast of the Proposed Project site and on the east side of I-5. The Proposed Project will not increase the local population or otherwise result in a change that will necessitate alteration or expansion of the public library or other existing public services. As a result, no impacts will result.

Operation and Maintenance – No Impact

After construction, the proposed Vine Substation will be unstaffed and will be visited by one or two workers on a daily or weekly basis. Routine maintenance of the substation is expected to require approximately six trips a year by a two- to four-person crew. In addition, it is anticipated that one annual major maintenance inspection will occur, requiring an estimated 10 personnel from SDG&E's existing workforce. The annual inspection will take approximately one week to complete. Operation and maintenance of the 12 kV distribution relocation, 69 kV loop-in, and telecommunication system extension will be conducted in a manner similar to the existing facilities in the area. These activities will not impede the use of existing public services nor result in a need for new services because they will be limited to routine periodic visits once a year and for no more than a few days on each occasion. As a result, there will be no impacts to public services from the operation and maintenance of the Proposed Project.

4.14.4 Applicant-Proposed Measures

Because the Proposed Project will have no impacts on public services, no applicant-proposed measures are proposed.

4.15 RECREATION

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				✓
b) Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?				✓

4.15.0 Introduction

This section describes the existing recreational facilities in the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt Substation Project (Proposed Project) site and evaluates potential impacts to recreational resources that may result from construction, operation, and maintenance of the Proposed Project. It is not anticipated that recreational facilities will be impacted as a result of construction of the Proposed Project.

4.15.1 Methodology

The recreation analysis involved a review of the City of San Diego General Plan. In addition, Google Earth aerial photographs of the Proposed Project area were reviewed.

4.15.2 Existing Conditions

The nearest recreational facilities—Pioneer Park and Mission Hills Park—are located approximately 0.7 mile north of the Proposed Project and east of Interstate 5. The parks contain passive recreational areas, a playground, picnic facilities, a restroom, and a parking lot. Three additional parks and one recreational trail are located within approximately one mile of the Proposed Project. One of these parks is Balboa Park, which is comprised of more than 1,000 acres of museums, various gardens, and international cultural associations, as well as the San Diego Zoo.

4.15.3 Impacts

Significance Criteria

Standards of significance were derived from Appendix G of the California Environmental Quality Act Guidelines. Impacts to recreation would be considered significant if the Proposed Project:

- Increases the use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facilities would occur or be accelerated

- Requires the construction or expansion of recreational facilities to meet population demand, potentially resulting in an adverse physical effect on the environment

Question 4.15a – Recreational Facilities Use

Construction – No Impact

It is anticipated that up to 33 workers will be employed for the site development phase of the Proposed Project. Between 12 to 24 workers are expected during the foundation and below-grade work, as well as the construction of the proposed substation and power line facilities. The relocation of the 12 kV distribution circuits will require between 12 and 20 workers. However, these crew members will likely commute from the San Diego County area. The minor increase in daily worker population will not put additional demand on existing recreational facilities due to the small and temporary nature of the increase. Thus, no impact will occur.

Operation and Maintenance – No Impact

As described in Section 4.13 Population and Housing, the Proposed Project will not create a need for additional housing or long-term population immigration, which would result in a permanent increase in park use. No new employees will be hired to operate or maintain the Proposed Project facilities. The facilities will be operated and maintained by existing SDG&E personnel in the same manner that existing facilities in the surrounding area are operated and maintained. Thus, no impact will occur.

Question 4.15b – Recreational Facilities Changes

Construction – No Impact

The Proposed Project will be located in an area characterized predominately by light- and medium-industrial and office uses, parking lots, and rental car facilities, and will not involve the construction of new recreational facilities or the expansion of existing facilities. Therefore, there will be no impact.

Operation and Maintenance – No Impact

Operation and maintenance activities for the Proposed Project facilities will be conducted in a similar manner as they are for the existing facilities. Operation and maintenance practices do not currently impact recreational uses or facilities in the area; thus, no impacts will occur.

4.15.4 Applicant-Proposed Measures

The Proposed Project will not result in any significant impacts to recreational resources; therefore, no applicant-proposed measures are proposed.

4.16 TRANSPORTATION AND TRAFFIC

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?			✓	
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?			✓	
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				✓
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			✓	
e) Result in inadequate emergency access?			✓	
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?			✓	

4.16.0 Introduction

This section describes the existing transportation and traffic conditions within the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project) area and evaluates potential Proposed Project-related transportation and traffic impacts. A summary of existing roadways, transit and rail service, airports, and bicycle facilities are presented, as well as a description of the regulatory setting for transportation and traffic. In addition, an analysis of transportation and traffic impacts that will result from the Proposed Project is provided. The Proposed Project is located adjacent to several major roadways (including Interstate [I-] 5, Kettner Boulevard, and Pacific Highway) and rail lines, but will not have a significant impact on transportation and traffic in the area and will not conflict with any adopted alternative transportation policies.

4.16.1 Methodology

Transportation and traffic data for the Proposed Project area was obtained primarily through relevant literature and Internet research. The City of San Diego General Plan and Municipal Code, the Midway/Pacific Highway Corridor Community Plan, the City of San Diego Traffic Impact Study Manual, and the San Diego Association of Governments' (SANDAG) 2030 Regional Transportation Plan were reviewed. A site visit was also conducted on December 10, 2013 to obtain a visual understanding of the traffic patterns along the public roadways that may be directly or indirectly affected by the Proposed Project.

4.16.2 Existing Conditions

Regulatory Background

Construction projects that cross public transportation corridors are subject to federal, state, and local encroachment permits. Permits are also required for activities that result in the use or obstruction of navigable airspace. The following summarizes transportation and traffic regulations that are applicable to the construction of electric facilities, such as the Proposed Project.

Federal

All airports and navigable airspace not administered by the Department of Defense are under the jurisdiction of the Federal Aviation Administration (FAA). Title 14, Section 77 of the Code of Federal Regulations (CFR) establishes the standards and required notification for objects affecting navigable airspace. In general, construction projects that exceed 200 feet above ground level—or that extend at a ratio greater than 100 to one (horizontal to vertical) from a public or military airport runway less than 3,200 feet long out to a horizontal distance of 20,000 feet—are considered potential obstructions and require notification to the FAA.

State

The use of California state highways for purposes other than normal transportation may require written authorization or an encroachment permit from the California Department of Transportation (Caltrans). Caltrans has jurisdiction over the state's highway system and is responsible for protecting the public and infrastructure. Caltrans reviews all requests from utility companies that plan to conduct activities within its right-of-way (ROW). Encroachment permits

may include conditions or restrictions that limit when construction activities can occur within or above roadways under the jurisdiction of Caltrans.

Local

Chapter 12, Article 9, Division 7: Public ROW Permits of the City of San Diego Municipal Code addresses the use of or encroachment into public ROWs for private uses. The City requires approval of a Public ROW Permit for the construction of privately owned structures or facilities within the public ROW.

The Mobility Element of the City of San Diego General Plan provides measures for improving the efficiency of the city's transportation system and facilitates the long-term planning required to improve mobility through the development of a balanced, multi-modal transportation network, while minimizing potential environmental and neighborhood impacts. The Mobility Element is aimed at creating a system wherein each mode of transportation contributes to an overall goal of providing transit services that meet varied user needs, while implementing a strategy to reduce traffic congestion and provide increased transportation choices with consideration for varying land use types. The City of San Diego also utilizes a Traffic Impact Study Manual, which provides acceptable level of service (LOS) standards for the city, as well as triggers and guidelines for the preparation of traffic studies.

SANDAG's 2030 San Diego Regional Transportation Plan: Pathways for the Future was approved in October 2011 and provides guidance for the establishment of a coordinated transportation system for the greater San Diego area. The plan is intended to connect and improve the regional transportation network of freeways, public transit, and roadways.

Existing Roadway Network

The Proposed Project is located in a primarily industrial and commercial area within the City of San Diego. Figure 3-1: Project Location Map in Chapter 3 – Project Description depicts the location of the Proposed Project area and the existing roadway network. A list of roadways that are adjacent to the Proposed Project and that may be used for construction equipment travel has been included in Table 4.16-1: Public Roadways Adjacent to the Proposed Project Area. This list also includes the classification, number of lanes, LOS information (where available), and the allowable increase in traffic volume for each roadway per the City of San Diego Traffic Impact Study Manual.

I-5 is a major north-south transportation corridor located approximately 150 feet east of the Proposed Project area. It is an eight-lane divided freeway with a posted speed limit of 70 miles per hour. I-5 will serve as the main route to the Proposed Project area. Construction vehicles and equipment will likely utilize the South Kettner Boulevard and the North India Street exits from I-5 to access the Proposed Project.

Within the Proposed Project area, Vine Street, Sassafras Street, West Laurel Street, and West Hawthorn Street are local public streets that run east-west; Kettner Boulevard, California Street, and Pacific Highway run north-south. Access to the Vine Substation will be accomplished from Vine Street during construction via the existing driveway. Access to the 69 kV loop-in will primarily occur from Vine Street, California Street, and Pacific Highway.

Table 4.16-1: Public Roadways Adjacent to the Proposed Project Area

Roadway	Cross Street	Number of Lanes	Average Weekday Traffic Volume	LOS a.m./p.m. Peak	Allowable Increase in Volume/Capacity Ratio
Vine Street	Kettner Boulevard and California Street	2	Not Available (NA)	NA	NA
Kettner Boulevard	Vine Street	3	19,300	C	0.04
California Street	Vine Street	2	NA	NA	NA
Pacific Highway	Sassafras Street	6	23,000	A	0.10
Sassafras Street	Kettner Boulevard and Pacific Highway	3	9,700	C	0.04
West Laurel Street	Kettner Boulevard and Pacific Highway	4	14,600	E/F	0.02
West Hawthorn Street	Kettner Boulevard and Pacific Highway	3	25,200	C	0.04

Source: SANDAG, 2008; City of San Diego Traffic Impact Study Manual.

Railway

The North Country Transit District (NCTD) Coaster provides commuter rail service to the Proposed Project area. The Coaster tracks are located immediately adjacent to and west of the proposed Vine Substation. These tracks will also be spanned by the 69 kV loop-in's overhead conductors. The service links the North County and the City of San Diego and operates more than 20 Coaster trains each weekday, with 10 trains operating on Saturdays. The Coaster does not operate regular service on Sundays.

Amtrak California (a service of Caltrans and Amtrak) operates the Pacific Surfliner train, which runs from San Luis Obispo to the Santa Fe Depot in the City of San Diego. The tracks along which the Amtrak trains travel are owned by the BNSF Railway. In the vicinity of the Proposed Project, Amtrak is located adjacent to the Coaster; therefore, it will be located directly adjacent to and west of the proposed Vine Substation. These tracks will also be spanned by the 69 kV loop-in's overhead conductors. The Pacific Surfliner runs between five and seven trains on a daily basis, generally between 5:50 a.m. and 12:59 p.m.

Airports

San Diego International Airport (also known as Lindberg Field) is located directly adjacent to and west of the Proposed Project. This airport operates approximately 600 arrivals and departures daily along a single runway that measures approximately 9,400 feet long. The airport is operated by the San Diego County Regional Airport Authority.

Bus

Bus service to the Proposed Project area is provided by the San Diego Metropolitan Transit System (MTS). Routes serving the immediate Proposed Project area include routes 10, 30, and 150. The closest bus stop is located on Washington Street, which is located approximately 0.3 mile north of the Proposed Project. This bus stop is serviced by Route 10. There are no bus routes that travel adjacent to the Proposed Project area along Kettner Boulevard.

Trolley

The MTS Trolley's Green Line connects downtown San Diego in the south to the City of Santee in the northeast. This trolley line is located adjacent to the Proposed Project area, and runs along California Street. The nearest stations are the Washington Street Station and the Middletown Station. Westbound weekday service from the Santee station to downtown begins at 5:04 a.m. and continues until 11:19 p.m., with trolleys departing every 15 minutes. Eastbound weekday service from the Downtown Station (12th and Imperial) to Santee begins at 4:51 a.m. and continues until 11:36 p.m., with trolleys departing every 15 minutes.

Bicycle Facilities

The City of San Diego designates and maintains three types of bicycle facilities—bike paths, bike lanes, and bike routes. Within the vicinity of the Proposed Project site, an existing bikeway runs along Pacific Highway. The bikeway is designated as a Class III bike route (i.e., shared use with motor vehicle traffic within the same travel lane) north along Pacific Highway to Washington Street. At Washington Street, the bikeway becomes a Class II bike lane (i.e., exclusive bicycle travel as defined by pavement striping) and continues north toward Mission Bay.

4.16.3 Impacts

Significance Criteria

Activities associated with construction of the Proposed Project will have the potential to affect existing traffic patterns or cause traffic delays due to the transport of equipment and materials to and from the Proposed Project area. Due to the nature of the proposed land use, traffic resulting from operation and maintenance activities of the proposed Vine Substation and associated components will generate minimal effects on the existing circulation system, as typically a limited amount of vehicular activity (i.e., less than one vehicle trip per day) will be required over the long-term. As a result, the following analysis of Proposed Project-related traffic impacts is generally focused on the construction phase. Operational impacts are addressed and analyzed, where appropriate, with regard for the significance criteria.

According to Appendix G of the California Environmental Quality Act Guidelines, impacts to transportation and traffic would be considered significant if the Proposed Project:

- Results in a conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the circulation system
- Results in a conflict with an applicable congestion management program
- Results in a change in air traffic patterns
- Results in a substantial increase in hazards due to design feature or incompatible uses
- Results in inadequate emergency access
- Conflicts with adopted policies, plans, or programs supporting alternative transportation

Question 4.16a – Circulation Plan or Policy Conflicts

Construction – Less-than-Significant Impact

Construction of the Proposed Project will not result in a conflict with relevant circulation plans or policies establishing measures of effectiveness for the performance of the circulation system. While lanes of travel along Kettner Boulevard will be closed to traffic during the relocation of the distribution circuits, this work will be short-term in nature and will occur at night when vehicle, bicycle, and pedestrian traffic is at its lowest level. In addition, at least one lane of travel through construction areas will always remain open to circulation for cars, buses, bicycles, and pedestrians utilizing the public ROW, as will be consistent with requirements of the Proposed Project's Public ROW Permit. Because the Proposed Project will comply with all requirements of the Public ROW Permit, there will be no conflict and no impact.

No policies or requirements related to the Proposed Project were identified within the SANDAG 2030 San Diego Regional Transportation Plan: Pathways for the Future. The Proposed Project will comply with Policy ME-A.5 of the Mobility Element of the City of San Diego General Plan. This policy states that adequate sidewalk widths and clear paths of travel should be provided for pedestrian usage, and obstructions and barriers that inhibit pedestrian circulation should be minimized. While temporary sidewalk closures may be required as part of the Proposed Project during relocation of the 12 kV distribution lines and extension of the telecommunication system, this work is anticipated to occur at night when pedestrian traffic will be limited. In addition, alternative pedestrian walking routes around construction areas will be provided during any closures. Vaults and hand holes associated with the 12 kV distribution relocation and telecommunication system extension will be placed underground and any aboveground fixtures will be placed so that they do not obstruct pedestrian circulation in the area. Thus, the Proposed Project is consistent with Policy ME-A.5, and there will be no impact.

Construction of the Proposed Project will not impact policies related to mass transit providers, as no such policies were identified that relate to the Proposed Project. While new poles associated with the 69 kV loop-in will be placed adjacent to the Coaster, Amtrak, and Trolley rail lines west of the proposed Vine Substation site, construction will not conflict with any policies related to the rail system operation. Stringing the overhead line from the new poles into the proposed Vine Substation will be conducted over the rail tracks and could potentially impact the operation of the trains and Trolley. However, SDG&E will coordinate with rail transit providers to conduct work at night (or during other transit provider-preferred times) when train service is less

frequent. SDG&E will obtain the necessary Right-of-Entry permits from the NCTD and MTS, as well as a License Agreement from the NCTD, and a Temporary Occupancy Agreement and a Utility Agreement License from BNSF Railway. As a SDG&E ordinary construction restriction, the Proposed Project will comply with all requirements of applicable encroachment permits and approvals; therefore, impacts from conflicts with applicable plans and policies will be less than significant.

Operation and Maintenance – No Impact

Routine maintenance is expected to require approximately six trips per year by a two- to four-person crew. No alternative modes of transportation such as rail, bus, or bicycle traffic or pedestrian circulation patterns would be altered or adversely affected by long-term operation and maintenance activities. As such, no impact will occur.

Question 4.16b – Congestion Management Program Conflict

Construction – Less-than-Significant Impact

The City of San Diego Traffic Impact Study Manual provides acceptable LOS standards for the city. For roadways and intersections in the urban areas of the city, the acceptable LOS standard is D, and the LOS standard in undeveloped areas is C. Table 4.16-1: Public Roadways Adjacent to the Proposed Project Area shows the LOS levels of the roadways in the Proposed Project area and provides the allowable increase of the volume/capacity ratio that will trigger a significant impact. It is anticipated that up to 33 workers will be employed for the site development phase of the Proposed Project. Between 12 and 24 workers are expected during the foundation and below-grade work, as well as the construction of the proposed Vine Substation. The 12 kV distribution relocation will require between 12 and 20 workers. Final testing and checkout will require nine electricians and/or engineers. Construction workers' daily transportation is not expected to cause a significant impact because Proposed Project-generated traffic will be minimal, will occur over the course of the day, and will not result in an increase of the volume/capacity ratio to the point that a significant impact will occur, per the City of San Diego Traffic Impact Study Manual.

Vehicle trips generated by construction personnel will generally occur with workers arriving at the site in the morning and leaving the site at the end of the day, with limited worker-related trips to or from the worksite during the course of the day. It is estimated that construction personnel will generate a maximum of 63 personal vehicle trips per day during peak construction times. On average, approximately 33 personal vehicle trips per day will be required. To reduce the potential number of daily worker-related vehicle trips to and from the site, SDG&E will encourage carpooling to the greatest extent possible.

It is anticipated that construction of the Proposed Project will require a maximum of 27 truck trips per day during the three months of proposed substation grading. In addition, approximately five additional trips per day are anticipated for the delivery of materials and equipment for the duration of construction. All construction vehicles and equipment will enter the proposed Vine Substation site from Vine Street. Although some disruption to traffic flow may occur when trucks ingress or egress the proposed Vine Substation site, such events will be periodic and temporary. As needed, signage or flagmen may be utilized to reduce potential disruptions to traffic flow and to maintain public safety during construction.

As described previously, lanes of travel within Kettner Boulevard will be limited during relocation of the 12 kV distribution circuits, which could impact the LOS in the area. However, this work will be short-term in nature, lasting up to a few weeks at a time, and will occur at night when vehicle traffic is at its lowest level. Trenching operations will be staged in intervals so that only a maximum of 500 feet of trench will be left open at any one time, or as allowed by permit requirements, thus the overall impact will be limited. In addition, SDG&E will coordinate with the City of San Diego through the Public ROW Permit process and comply will all requirements of the Proposed Project's Public ROW Permit. SDG&E, as part of their ordinary construction restrictions, will prepare and implement a Traffic Management Plan to further reduce potential impacts. As required by the City of San Diego, the Traffic Management Plan will provide a detailed drawing of the area where work will occur—including any transition area, buffer space, work area, and termination area—directional signage to be posted, a detour plan (if required), and a pedestrian and bicycle plan.

Because the increase in vehicle trips potentially generated by the Proposed Project during construction will add an insignificant percentage of traffic to surrounding roadways and will not trigger a significant impact per the City of San Diego Traffic Impact Study Manual, and because SDG&E will comply with the requirements of the Proposed Project's Public ROW Permit, there will be no conflict with congestion management programs and impacts as a result of conflicts with such programs will be less than significant.

Operation and Maintenance – No Impact

Routine maintenance is expected to require approximately six trips per year by a two- to four-person crew. Routine operations will require one to two workers in a light utility truck to visit the proposed Vine Substation on a daily or weekly basis. Vehicle trips associated with operation and maintenance activities will constitute a negligible increase in traffic in the area and will not affect roadway LOS or result in conflicts with other congestion management plans or policies. As a result, there will be no impact.

Question 4.16c – Air Traffic Changes

Construction – No Impact

At this time, helicopter use is not anticipated for the construction of the Proposed Project. Because no aircraft will be required for the Proposed Project, no changes to air traffic patterns will be required to accommodate construction. Thus, there will be no impact.

Because the Proposed Project is located within 20,000 feet of the San Diego International Airport, an FAA Obstruction Evaluation is required to be completed prior to construction, pursuant to Part 77 of the CFR and San Diego International Airport Land Use Compatibility Plan requirements. Because the 69 kV steel poles—which will reach approximately 100 feet high and are approximately 2,100 feet from the nearest active runway—will exceed the one-to-100 ratio required by 14 CFR Part 77.9 for airspace and navigation, SDG&E will consult with the FAA. The FAA will conduct an obstruction evaluation, for which the resulting requirements will be implemented by SDG&E. Therefore, it is not anticipated that the Proposed Project will result in a change in air traffic patterns or an increase in safety risks and no impact to air traffic will occur.

Operation and Maintenance – No Impact

Operation and maintenance activities will include routine inspections, ongoing maintenance, and repairs necessary to ensure that integrity of the system is maintained over the long-term. Inspections may occur in the form of aerial patrol through the use of helicopters, or through ground patrols visiting the facilities. Consistent with the approach toward other facilities in the area, if helicopters are used to assist with operation and maintenance activities, SDG&E will notify the FAA and any additional local agencies, as appropriate, prior to conducting maintenance activities requiring a helicopter. Therefore, no impact will occur.

Question 4.16d – Increase in Hazards

Construction – Less-than-Significant Impact

Construction of the Proposed Project will result in temporary traffic lane closures at night along Kettner Boulevard during the 12 kV distribution relocation and telecommunication system extension. Additional lane closures during the day will occur along Pacific Highway during the installation of new poles and conductor for the 69 kV loop-in. These lane closures could increase hazards if appropriate safety measures are not in place, such as proper signage, orange cones, and flaggers. However, SDG&E will obtain the required Public ROW Permit from the City of San Diego and will implement the traffic control measures articulated by that permit. While there may be a limited increase in hazards due to obstructions implemented as part of the lane closures, the closures will be temporary and will be conducted in compliance with City of San Diego safety standards and requirements. Therefore, impacts will be less than significant.

Operation and Maintenance – No Impact

New facilities are being placed within roadways as part of the 12 kV distribution relocation and telecommunication system extension; therefore, it is anticipated that the number of temporary lane closures necessary to accommodate routine operation and maintenance activities will likely increase to a small degree. While temporary roadway obstruction could result in increased hazards, the frequency and duration of these closures will be short-term and limited to a few times per year. In addition, SDG&E will implement necessary traffic control measures and Public ROW Permit requirements. Thus, any increase in hazards will be minimal and the impact will be less than significant.

Access to the proposed Vine Substation will occur primarily from Vine Street. The existing driveway that serves the current parking lot will be relocated approximately 50 feet southwest along Vine Street to connect to the proposed Vine Substation's interior access road. An existing driveway along Kettner Boulevard will also be relocated approximately 125 feet southeast and will provide secondary access to the proposed Vine Substation. The relocated driveways will be constructed in compliance with current standards for width and sight-distance visibility and will be similar to other commercial driveways in the immediate vicinity. Because the relocated driveways will be constructed in accordance with required standards and primary access will occur from a street with limited traffic, the potential for increased hazards will be less than significant.

Question 4.16e – Emergency Access Effects

Construction – Less-than-Significant Impact

Emergency access will not be directly impacted during construction because all streets will remain open to emergency vehicles at all times throughout construction. Although lane closures along Kettner Boulevard will occur during relocation of the distribution circuits, at least one lane will remain open to provide access for emergency vehicles. Further, SDG&E will coordinate with adjacent businesses and local emergency providers to ensure that ingress and egress routes are maintained for the duration of Proposed Project construction. In addition, construction of the proposed Vine Substation will not require any road closures and no improvements to public roadways are required. Therefore, impacts to emergency access will be less than significant.

Operation and Maintenance – No Impact

Operation and maintenance activities associated with the Proposed Project are not expected to generate additional traffic on area roadways, as compared to existing conditions. While temporary road closures could increase due to maintenance activities for the 12 kV distribution relocation and telecommunication system extension, the closures will be limited and short-term, as described previously. In addition, emergency vehicle access will always be provided during operation and maintenance activities. As such, no impacts on emergency vehicle access will occur during operation and maintenance activities for the Proposed Project.

Question 4.16f – Alternative Transportation Conflicts

Construction – Less-than-Significant Impact

The Proposed Project is located in a highly urbanized area. Construction will occur within the public ROW and on SDG&E-owned land. The Proposed Project will not involve any activities that will conflict with alternative transportation policies, plans, or programs, including bus transportation in the area. SDG&E will obtain Public ROW Permits to conduct work within the public ROW and will ensure that access for pedestrians and bicyclists is provided during construction. Rail tracks utilized by the Coaster, Amtrak, and Trolley are located adjacent to the proposed Vine Substation site, and conductor pulling activities will occur over the tracks, which could impact operations of these rail services. However, SDG&E will coordinate with the rail agencies to conduct work at night (or during other transit provider-preferred times, as feasible) to minimize rail service disruptions or delays. Therefore, impacts to alternative transportation modes will be less than significant.

Operation and Maintenance – No Impact

The operation and maintenance activities for the Proposed Project will not change from current practices that are conducted on other facilities located in the vicinity, which require less than one vehicle trip, on average, per day. Rail, bus, and bicycle traffic are not affected by current operation and maintenance activities, and there will be no change to the activities as a result of the Proposed Project. Therefore, no impact will occur.

4.16.4 Applicant-Proposed Measures

Any impacts resulting from conflicts with applicable transportation-related policies as a result of construction of the Proposed Project will be less than significant. In addition, the Proposed

Project will not create significant air traffic or transportation-related hazards or result in a significant impact to emergency access in the area. As such, no applicant-proposed measures are proposed.

4.17 UTILITIES AND SERVICE SYSTEMS

Would the Proposed Project:	Potentially Significant Impact	Less-than-Significant Impact with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?				✓
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities (the construction of which could cause significant environmental effects)?				✓
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities (the construction of which could cause significant environmental effects)?				✓
d) Have sufficient water supplies available from existing entitlements and resources to serve the project from existing entitlements and resources, or are new and expanded entitlements needed?				✓
e) Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?				✓
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?			✓	
g) Comply with federal, state, and local statutes and regulations related to solid waste?				✓

4.17.0 Introduction

This section describes local utility services and infrastructure—including cable television and telephone, water treatment, water supply availability, sewer, solid waste disposal, and electricity services—in the vicinity of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt Substation Project (Proposed Project). The Proposed Project will not require the

use of public utilities during construction, operation, or maintenance activities, with the exception of minimal water use during construction activities to control dust on non-paved portions of the Proposed Project area. A temporary tap to an existing distribution line may be installed to provide electrical service to the staging area within the proposed Vine Substation during construction. This temporary tap may be used to power construction trailers, lighting, or small hand-held machinery or tools until the substation is energized. The Proposed Project will generate a limited amount of solid waste during construction; which will ultimately be transported to nearby licensed landfill. Construction of the Proposed Project will not substantially increase the existing velocity or volume of storm water flows either on-site or in off-site areas. Areas disturbed during grading will be restored to their original contours, and the surrounding area will be repaired, as appropriate. Therefore, the Proposed Project will result in less-than-significant impacts to utilities and service systems.

4.17.1 Methodology

Information regarding local utilities was obtained from the City of San Diego's General Plan and Urban Water Management Plan. Internet searches were also conducted to gather information regarding utility service providers in the vicinity of the Proposed Project.

4.17.2 Existing Conditions

Potable Water

Water service within the City of San Diego is provided by the Public Utilities Department through a purchase agreement with the San Diego County Water Authority (SDCWA)—a wholesale water agency that provides imported water to its 24 member agencies. The SDCWA, in turn, purchases the majority of its water from the Metropolitan Water District of Southern California (MWD), which is comprised of 26 cities and water agencies serving 18 million people in six counties. The MWD imports water from two primary sources: from the Colorado River via the MWD's Colorado Aqueduct and from Northern California via the State Water Project (SWP). Water is delivered to Southern California by way of the MWD's approximately 242-mile-long aqueduct, which transports Colorado River water from Lake Havasu to MWD's service area. In addition, water from Northern California is delivered to Southern California through an approximately 444-mile-long aqueduct. The water is captured in reservoirs north of Sacramento and released through natural rivers and streams into the Sacramento-San Joaquin Delta. The MWD then blends the Colorado River and SWP water at a facility in Riverside County and transfers the untreated water via pipelines operated by MWD and SDCWA to the city's three treatment facilities—the Miramar Water Treatment Plant, the Alvarado Water Treatment Plant, and the Otay Water Treatment Plant.

Water within the City of San Diego is also obtained from the City's local water supplies consisting of nine surface water reservoirs with more than 408,000 acre-feet of capacity, eight of which are connected directly or indirectly to the city's three water treatment facilities. The geographic areas served by the three water treatment facilities are flexible such that various areas within the City of San Diego can be supplied by more than one of the treatment plants.

Water Drainage Facilities

As described in Attachment 4.4-B: Biological Survey Memo, small concrete-lined drainage designed for storm water conveyance is located on the west side of the proposed Vine Substation site. The channel is an approximately 12-inch wide concrete v-ditch that was designed for storm water conveyance. There was no vegetation or accumulated sediment observed within the channel. No other drainage facilities are located in the Proposed Project area or in the immediate area surrounding the Proposed Project.

Electricity

Electricity in the City of San Diego is provided by SDG&E.

Cable and Telephone

Telephone, wireless phone, video/cable, and internet services are available from AT&T for residents within the Proposed Project area. Cox Communications and Time Warner Cable also provide cable, broadband, and phone services.

Sewer

The Metropolitan Wastewater System provides sewer services to the City of San Diego and 15 other cities and districts from a 450-square-mile are with a population of over 2.2 million. An average of 180 million gallons of wastewater is treated daily. Wastewater is conveyed through approximately 2,987 miles of collection pipelines and 83 pump stations to the North City Water Reclamation Plant, the Point Loma Wastewater Treatment Plan, and the South Bay Water Reclamation Plant. Treated effluent is discharged to the Pacific Ocean through two ocean outfalls. Solids from the wastewater treatment plants are processed at the Metro Biosolids Center located at the Marine Corps Air Station Miramar.

Solid Waste

Non-recyclable solid waste disposal in the City of San Diego is accommodated by the Miramar Landfill—a city-operated landfill. The Miramar Landfill is the City of San Diego's only active landfill and is located north of Highway 52 at 5180 Convoy Street. The Miramar Landfill accommodates approximately 910,000 tons of waste per year and is expected to reach capacity by the year 2022. The Miramar Landfill is owned and operated by the City of San Diego, which also provides solid waste curbside pick-up service within city limits. Currently, only two other landfills provide disposal capacity within the urbanized region—Allied Waste's Sycamore and Otay landfills. The Sycamore Landfill is located to the east of the Proposed Project, within the City of San Diego's boundaries, and the Otay Landfill is located south of the Proposed Project in the City of Chula Vista.

4.17.3 Impacts

Significance Criteria

Potential impacts to public utilities and service systems were determined in accordance with Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Impacts to public utilities and service systems would be considered significant if the Proposed Project:

- Exceeds wastewater treatment requirements of the Regional Water Quality Control Board (RWQCB)
- Requires or results in the construction of new water or wastewater treatment facilities or expansion of existing facilities
- Requires or results in the construction of new storm water drainage facilities or the expansion of existing facilities
- Results in the need for a new or expanded water supply
- Results in a determination by the wastewater treatment provider that it has inadequate capacity to serve the Proposed Project's projected demand
- Results in inadequate access to a landfill with sufficient permitted capacity to accommodate the Proposed Project's solid waste disposal needs
- Causes a breach of national, state, or local standards relating to solid waste

In addition to the guidelines specified in Appendix G, the Proposed Project would have significant adverse impacts to public utilities and service systems if it resulted in the disruption of existing utility systems.

Question 4.17a – Wastewater Treatment Requirement Exceedances

Construction – No Impact

Construction of the Proposed Project will not generate wastewater. Portable toilets will be provided for on-site use by construction workers and will be maintained by a licensed sanitation contractor. Portable toilets will be used in accordance with applicable sanitation regulations established by the Occupational Safety and Health Administration, which generally requires one portable toilet for every 10 workers. The licensed contractor will dispose of the waste at an off-site location and in compliance with standards established by the RWQCB.

No dewatering is anticipated during construction. However, in the event that groundwater is encountered, dewatering may be necessary. The water will be pumped to a desiltation tank and tested to ensure compliance with the RWQCB National Pollutant Discharge Elimination System requirements. The water will be discharged to land, transported to a nearby sewer inlet, or disposed of at an approved SDG&E disposal site. As a result, it will not require treatment at a wastewater facility and no impact will occur.

Operation and Maintenance – No Impact

Long-term operation and maintenance of the proposed Vine Substation will not generate wastewater. The substation will be unstaffed and no sanitary facilities that require waste treatment will be constructed on site. Thus, no impact will result.

Question 4.17b – Water and Wastewater Treatment Facility Expansion

Construction – No Impact

As part of SDG&E's ordinary construction restrictions, water will be applied to non-paved portions of the Proposed Project area to control dust. Because this water will be dispersed on site and will either evaporate or be absorbed into the ground, no wastewater is anticipated. In addition, portable restrooms will be used and maintained during construction and removed after the completion of the Proposed Project. Construction of the Proposed Project will not require additional capacity to existing municipal water or wastewater treatment systems and, therefore, will have no impact on these systems.

Operation and Maintenance – No Impact

Wastewater will not be generated by long-term operation and maintenance of the Proposed Project. Water use will be limited to irrigation of any on-site landscaping associated with the facilities. No sanitation facilities will be located on site and, therefore, no impact will occur.

Question 4.17c – Stormwater Drainage Facilities

Construction – No Impact

Construction-related activities will result in minor deviations to the existing drainage patterns on site, due to grading, and will have the potential to temporarily contribute additional runoff water to existing or planned storm water drainage systems during construction. The Proposed Project site is currently paved and relatively flat and will be graded with minimal slope, similar to the existing slope found on site. Therefore, such changes will not substantially increase the existing velocity or volume of storm water flows either on-site or in off-site areas. All areas outside of the proposed Vine Substation parcel that will be disturbed during grading will be restored to their original contours, and the surrounding area will be repaired, as appropriate. To reduce potential impacts to water quality from runoff during construction activities, SDG&E will implement measures from its Water Quality Construction Best Management Practice (BMP) Manual. In addition, SDG&E will obtain coverage under the State Water Resources Control Board's General Permit for Storm Water Discharges Associated with Construction Activity Order No. 2009-0009-DWQ. SDG&E will implement the Proposed Project's Storm Water Pollution Prevention Plan to reduce impacts to municipal storm water drainage facilities. The use of BMPs during construction activities to control runoff will not necessitate the construction of new storm water drainage facilities or expansion of existing facilities. Therefore, no impact will occur.

Operation and Maintenance – No Impact

On-site drainage patterns established during construction will generally remain unchanged with long-term operation and maintenance of the proposed Vine Substation. The proposed grading improvements are not anticipated to result in impacts from increased on- or off-site erosion or siltation. As such, no impacts to drainage facilities will result.

Question 4.17d – Water Supply Availability

Construction – No Impact

Minimal water will be required during site grading and below-grade construction activities to control dust on non-paved portions of the Proposed Project area. Water will be brought to the site in trucks specially equipped to allow for the dispersal of water. Approximately 1,440,000 total gallons of water will be required for these activities. Water for the trucks will be obtained from municipal water sources. The City of San Diego has approximately 78 billion gallons of water available in its water supply during a normal year; therefore, a sufficient water supply is available to meet water demands for construction needs. The demand for water will be temporary and short-term, and no new entitlements will be required. Therefore, no impact will occur.

Operation and Maintenance – No Impact

Water use will be limited to irrigation of any on-site landscaping associated with the facilities (i.e., revegetative groundcover or landscape screening). This small quantity of water will be obtained from municipal sources. As a result, no impact will occur.

Question 4.17e – Wastewater Treatment Capacity – *No Impact*

As previously addressed in the responses to Questions 4.17a and 4.17b, construction, operation, and maintenance of the Proposed Project will not generate wastewater. Therefore, no impact will occur.

Question 4.17f – Landfill Capacity

Construction – Less than Significant Impact

The Proposed Project will generate a limited amount of solid waste during construction (i.e., refuse, spoils, trash, poles, etc.). All waste will ultimately be transported to the Miramar Landfill or another approved facility and disposed of properly and in accordance with all applicable federal, state, and local laws regarding solid and hazardous waste disposal. The Miramar Landfill has sufficient capacity to accommodate the amount of waste anticipated to be generated during construction. Therefore, impacts will be less than significant.

Operation and Maintenance – No Impact

The operation and maintenance of the Proposed Project will generate a limited amount of solid waste. The proposed substation will not require staff and will not produce waste. The only waste generated will be associated with operational equipment maintenance, crew lunches, and packaging material associated with replacement parts. Excess material or waste resulting from the repair or replacement of a structure or equipment (e.g., replacement of an insulator) will be taken to an existing SDG&E maintenance yard and will either be reused, recycled, or disposed of in accordance with federal, state, and local statutes and regulations. Any remaining waste will be minimal and will be properly disposed of at an approved landfill. Therefore, no impact will occur.

Question 4.17g – Solid Waste Statutes and Regulations

Construction – No Impact

Construction of the Proposed Project will generate a minimal amount of solid waste (i.e., refuse, spoils, trash, poles, etc.). As previously discussed in the response to Question 4.17f, solid waste produced during construction will be disposed of at a nearby licensed landfill. Management and disposal of solid waste will comply with all applicable federal, state, and local statutes and regulations. Thus, the Proposed Project will not violate any solid waste statutes or regulations, and there will be no impact.

Operation and Maintenance – No Impact

Handling and disposal of all waste products associated with operation and maintenance activities will comply with all applicable statutes and regulations. Therefore, no impact will occur.

4.17.4 Applicant-Proposed Measures

Because no potentially significant impacts relative to utilities and service systems will result from the Proposed Project, no applicant-proposed measures are provided.

4.18 CUMULATIVE ANALYSIS

4.18.0 Introduction

This chapter discusses potential cumulative impacts related to the construction and operation of the proposed San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project). As discussed in Chapter 2 – Purpose and Need, the purpose of the Proposed Project is to ensure that SDG&E maintains the reliability of the substation and distribution system in downtown and the surrounding area, provide added capacity to serve existing and future area load growth, and to prevent potentially long outages or disruption of service to existing and new customers in downtown San Diego and the surrounding area. Implementation of the Proposed Project will not result in a significant cumulative environmental impact in any of the resource areas evaluated under the California Environmental Quality Act (CEQA).

4.18.1 Significance Criteria

Section 15130(a)(1) of the CEQA Guidelines define a cumulative impact as one "which is created as a result of the project…together with other [past, present, and future] projects causing related impacts." Impacts will be considered significant if they exceed the individual criterion established for each resource area, as described in Sections 4.1 through 4.17; if this occurs, the Proposed Project's contribution will be analyzed to determine whether it is cumulatively considerable (Guidelines § 15064(h)(1)). Section 15064(h)(1) of the CEQA Guidelines further explains that "when assessing whether a cumulative effect requires an [Environmental Impact Report], the lead agency shall consider whether the cumulative impact is significant and [whether] the project's incremental effect, though individually limited, is 'cumulatively considerable.'" Applying this qualitative standard necessarily requires application of judgment based on the facts of a particular project subject to CEQA. Further, the significance of an impact may be weighed against the overall effect as both increases and decreases in impacts may balance one another. As noted in Section 15064(h)(4), the CEQA Guidelines, "the mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable."

4.18.2 Timeframe of Analysis

For the purpose of this cumulative impacts analysis, the Proposed Project is defined in terms of construction duration and post-construction operation and maintenance. SDG&E anticipates that construction of the Proposed Project will take a total of approximately 19 months. Construction of the proposed Vine Substation is anticipated to begin in January 2016. The operational lifetime of the Vine Substation is anticipated to be approximately 40 years.

4.18.3 Area of Analysis

A list of past, present, and planned future projects within one mile of the Proposed Project has been developed in accordance with CEQA Guidelines Section 15130(b). Potential cumulative impacts were analyzed within one mile of the Proposed Project components because this distance was estimated to be the farthest that Proposed Project impacts will extend.

4.18.4 Methodology

Existing conditions and reasonably foreseeable projects were identified within a one-mile radius of each Proposed Project component. Information was gathered from Internet searches of local planning department and state agency websites and correspondence with agency staff. The websites of the following entities were reviewed, and/or these agencies were contacted regarding development projects, road and utility improvement projects, and capital investment projects:

- California Energy Commission (CEC),
- California Department of Transportation (Caltrans),
- California Independent System Operator (CAISO),
- California Public Utilities Commission (CPUC),
- City of San Diego,
- County of San Diego,
- San Diego International Airport, and
- San Diego Unified Port District (Port District).

4.18.5 Existing/Operating Projects

Land uses surrounding the Proposed Project are characterized by light- and medium-industrial and office uses, parking lots, and rental car facilities. The Proposed Project site is bordered to the north by Vine Street and a commercial printing business across Vine Street, to the south by an Advantage Rental Car facility, to the east by Kettner Boulevard, and to the west by the Amtrak, North County Transit District Coaster and San Diego Metropolitan Transit System Trolley railroad tracks. As such, the existing and operating projects in the area consist mainly of commercial, industrial, and transportation activities, existing utility infrastructure operation and maintenance, and ongoing road maintenance.

4.18.6 Foreseeable Projects Inventory

For the purposes of this document, "reasonably foreseeable" refers to projects that federal, state, or local agency representatives have knowledge of resulting from the formal application process. Table 4.18-1: Planned and Proposed Projects Within One Mile lists 15 known projects that are within one mile of all of the Proposed Project components. An approximately one-mile radius is appropriate based on the size, location, and the minimal impacts associated with the Proposed Project. Given the approximately 1.5-acre size of the proposed substation site and its use strictly as a substation, it does not have the potential to change land use patterns in the area. The Proposed Project is located adjacent to the Interstate (I-) 5 freeway and east of Pacific Highway and is physically separated from any development projects to the west. The Proposed Project is also surrounded by existing commercial and industrial developments. Finally, the Proposed Project site has been previously disturbed as a result of the construction of a long-term parking lot. As an unstaffed substation, the Proposed Project will not generate a substantial amount of traffic that will be distributed into nearby intersections and roadways. For these reasons, the approximately one-mile radius is an appropriate distance to determine the potential for other reasonably foreseeable projects to be cumulatively considerable.

Table 4.18-1: Planned and Proposed Projects Within One Mile

Project	Approximate Location	Approximate Distance from the Proposed Project	Project Description/Size	Anticipated Construction Schedule	
				Start	End
San Diego County Regional Airport Authority Parking	North side of San Diego International Airport, west of Pacific Highway	0.25 mile	Construction of a public surface parking lot, which includes 1,964 parking spaces, three approximately 44-square-foot parking control kiosks, two approximately 60-square-foot shuttle bus shelters, an approximately 750-square-foot portable office trailer, an approximately 64-square-foot portable guard booth, an approximately 80-square-foot maintenance shed, fencing, landscaping, and approximately 35,606 cubic yards of grading (14,753 cubic yards of cut and 20,853 cubic yards of fill); and construction of an interior circulation road and associated utilities to provide access to the proposed parking lot	2013	2014
San Diego County Airport North Side Development Project – Fixed-Base Operator (FBO) Building	North side of San Diego International Airport, west of Pacific Highway	0.3 mile	Construction of a state-of-the-art FBO campus, with an approximately 20,000-square-foot terminal, an approximately 250,000-square-foot ramp, and five hangars on approximately 12.4 acres of airfield	2013	2014
San Diego County Airport North Side Development Project – Consolidated Car Rental Facilities	North side of San Diego International Airport, west of Pacific Highway	0.11 mile	Construction of an approximately 17-acre consolidated car rental facility	2013	2015

Project	Approximate Location	Approximate Distance from the Proposed Project	Project Description/Size	Anticipated Construction Schedule	
				Start	End
Pacific Highway Obstructed Curb Ramp Barrier Removal (Capital Improvement Project)	West side of Pacific Highway	0.35 mile	Installation of missing curb ramps at three locations along Pacific Highway: Frontage Road at Bandini Street, Estudillo Street, and Sutherland Street	2015	2015
Bayside Fire Station	1595 Pacific Highway (southeast corner of Pacific Highway and Cedar Street)	0.27 mile	Construction of a three-bay fire station	Not Available	Not Available
County Waterfront Park	Pacific Highway and Cedar Street	0.2 mile	Conversion of the existing, approximately eight-acre, on-grade parking lots north and south of the historic Administration Center to a large community and regional open space amenity. The park will include large civic greens, a children's play area, intimate garden rooms, and an expansive interactive fountain. Parking will be provided in a new underground parking garage off of Ash Street.	2012	2015
401 West Ash Street Hotel Development	Northeast corner of Ash, Colombia, and State streets	0.5 mile	Construction of a 410-room hotel, approximately 3,200 square feet of retail/commercial space, and 133 parking spaces.	2014	2016
Bella Pacifico Condominiums	Grape Street at Pacific Highway (1919 Pacific Highway)	0.12 mile	Construction of a 71-unit residential condominium development, approximately 3,200 square feet of retail and commercial space, and 118 parking spaces	Not Available	Not Available

Project	Approximate Location	Approximate Distance from the Proposed Project	Project Description/Size	Anticipated Construction Schedule	
				Start	End
Harbor View Hotel (Fat City)	Pacific Highway and Hawthorn Street	0.02 mile	Construction of a 364-room hotel	2013	2014
H.G. Fenton Development (India and Date Apartments)	Date Street between India Street and Columbia Street	0.25 mile	Construction of 97 apartment units and approximately 14,000 square feet of retail	Not Available	Not Available
Kettner and Ash Condominiums	Southwest corner of Kettner Boulevard and Ash Street	0.44 mile	Construction of 285 condominium residences and approximately 25,000 square feet of retail space	Not Available	Not Available
Lane Field North	900 West Broadway	0.72 mile	Construction of a 400-room, dual-branded hotel in a single building on the northern portion of the site fronting Pacific Highway, and an approximately two-acre public park on the western portion fronting Harbor Drive	Not Available	Not Available
Navy Broadway Complex	West side of Harbor Drive	0.84 mile	Development of approximately 1,265 square feet of office space, approximately 350,000 square feet of Navy office space, approximately 1,500 square feet of hotel space, approximately 160,000 square feet of retail space, and an approximately 40,000-square-foot museum	Not Available	Not Available
Pacific Highway and Broadway (Bosa Development)	East side of Pacific Highway at Broadway	0.72 mile	Construction of 232 condominium residences and approximately 16,000 square feet of retail	2014	2017
Palatine Apartments	North side of Fir Street between Columbia Street and State Street	0.19 mile	Construction of 101 apartment units	Not Available	Not Available

4.18.7 Potential Cumulative Impacts

This section discusses whether the Proposed Project will result in significant short-term or long-term environmental impacts when combined with other past, present, and planned and probable future projects in the area. Short-term impacts are generally associated with construction of the Proposed Project, while long-term impacts are those that result from permanent Proposed Project features or operation of the Proposed Project.

Construction, operation, and maintenance of the Proposed Project will not impact the following resources and, therefore, will not contribute to a cumulative effect in these areas:

- Agriculture and Forestry Resources,
- Biological Resources,
- Geology and Soils,
- Land Use and Planning,
- Mineral Resources,
- Population and Housing,
- Public Services,
- Recreation, and
- Utilities and Service Systems.

As a result, these resource areas were not further analyzed with regard to cumulative impacts.

Cumulative impacts to the following resources could occur as a result of construction of the Proposed Project in conjunction with the other planned and probable projects:

- Aesthetics,
- Air Quality,
- Cultural Resources,
- Greenhouse Gas Emissions,
- Hazards and Hazardous Materials,
- Hydrology and Water Quality,
- Noise, and
- Transportation and Traffic.

These resources are discussed further in the subsections that follow.

Aesthetics

Cumulative impacts to visual resources could occur where Proposed Project facilities are viewed in combination with other past, present, and probable developments. The significance of cumulative visual impacts depends on a number of factors, including the degree to which the viewshed is altered and the extent to which scenic resources in the area are disrupted due to either view obstructions or direct impacts to scenic resource features. The Proposed Project viewshed is defined as the general area from which it is visible or can be seen. For the purpose of this analysis, the potential effects on foreground viewshed conditions are emphasized. The

foreground is defined as the zone between 0.25 and 0.5 mile from the viewer. Landscape detail is most noticeable and objects generally appear most prominent when seen in the foreground.

The Proposed Project components will be located within an SDG&E right-of-way or within lands that are owned by SDG&E. The construction schedule for the Proposed Project could overlap with the construction schedules for three of the planned and proposed projects listed Table 4.18-1: Planned and Proposed Projects Within One Mile. An additional seven projects have construction timelines that are unknown and could overlap with the Proposed Project. These projects will increase the potential for adverse cumulative impacts to occur from construction equipment, vehicles, materials, staging areas, and project personnel. However, adverse visual impacts during construction will be temporary and are generally accepted by the public. While portions of the Proposed Project site will be visible during construction, surrounding lands are characterized by light- and medium-industrial and office uses, parking lots, and rental car facilities, and resulting visual impacts will be minimal when compared to the existing visual setting. In addition, the Proposed Project components are separated from the 401 West Ash Street Hotel Development by a distance of approximately 0.5 mile. The Pacific Highway Obstructed Curb Ramp Barrier Removal Project is located approximately 0.35 mile from the Proposed Project and will consist of minimal visual disturbances. While the San Diego County Airport North Side Development Project – Consolidated Car Rental Facilities Project will be located approximately 0.11 mile from the Proposed Project, these sites are separated by Pacific Highway and the San Diego International Airport to the west. In addition, views of construction from these cumulative projects would not likely be visible within the same view shed as the Proposed Project given the intervening topography and existing structures. These temporary aesthetic impacts will be cumulative; however, they are not expected to be significant.

Permanent cumulative visual impacts could occur as a result of project components being located near other proposed developments in the project area. Expected visual changes associated with the future development in the project area will result from a combination of the Proposed Project with other planned projects. Twelve of the projects identified in Table 4.18-1: Planned and Proposed Projects Within One Mile are located within 0.5 mile of the Proposed Project. However, from many locations in the surrounding area, views of the Proposed Project are partially or fully screened by intervening topography and structures. The Proposed Project will represent an incremental visual change to the urban landscape, and given the industrial setting, will not be particularly noticeable. The introduction of landscaping along Vine Street also results in a minor improvement to the streetscape. Further, the earth-toned masonry perimeter wall (in place of the chain link fence) that will be constructed as part of the Proposed Project will reduce visual clutter within this predominantly industrial landscape. In addition, the Proposed Project will not substantially affect views of the San Diego Bay or the downtown San Diego skyline. For these reasons, the Proposed Project is not expected to result in a cumulatively considerable impact to aesthetics.

Air Quality

The construction schedule for the Proposed Project and three of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile could occur simultaneously. In addition, the construction schedules for seven additional projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile are unknown and could overlap with the Proposed

Project. As a result, a cumulative air quality impact could occur in the Proposed Project area during construction. SDG&E will implement ordinary construction restrictions to reduce emissions and dust during construction, as discussed in Section 4.3 Air Quality. Similarly, other projects within the study area will be required to comply with local ordinances and regulations regulating air quality, including dust control during construction activities. Measures will be required for the cumulative projects to reduce potential impacts on air quality to less than significant. As a result, cumulative impacts are expected to be less than significant.

In addition, a significant impact may occur if a project is inconsistent with the rules and regulations of the San Diego County Air Pollution Control District (SDAPCD) or if it induces growth in excess of that anticipated by the SDAPCD Regional Air Quality Strategy. Long-term operation of the proposed Vine Substation will not include any permanent, stationary sources of pollution, and will not induce population growth or area employment. Therefore, the Proposed Project will not contribute to a cumulatively considerable air quality impact associated with operation or power generation, or population growth.

Cultural Resources

Cumulative impacts to cultural resources could occur as a result of increased ground-disturbing activities by multiple projects within the study area. The results of the record search conducted for the Proposed Project indicate that no cultural resources or cultural resource sites are located within the Proposed Project area. However, ground-disturbing construction activities have the potential to inadvertently impact unknown cultural resources within the Proposed Project area. These activities disturb subsurface soils and can potentially disturb or destroy unknown buried cultural deposits (i.e., archaeological sites). However, the Proposed Project areas have been previously disturbed for the construction of the parking lot and roadways; therefore, the potential to discover unknown cultural resources is unlikely. All the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile will occur within areas that are previously disturbed/developed, and where no resources are likely to occur. As a result, no cumulative impacts are anticipated.

Although no known paleontological resources have been identified on the Proposed Project site, the site is located in an areas with a high potential—the Bay Point and San Diego formations—and moderate potential—within the Lindavista Formation—for discovery of a sensitive paleontological resource. As such, fossils may be encountered during excavation activities for the Proposed Project. However, due to the disturbed nature of the Proposed Project area, the likelihood of discovering buried paleontological resources is improbable. In addition, all projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile will occur within areas that are previously disturbed/developed, where the likelihood of encountering paleontological resources is unlikely. Regardless, SDG&E will implement the APMs discussed in Section 4.5.4 Applicant-Proposed Measures, which include implementation of a complete paleontological resource mitigation program that will reduce the Proposed Project's impacts to a less-than-significant level. For these reasons, the Proposed Project will not result in a cumulatively considerable impact to paleontological resources.

Operation and maintenance activities associated with the Proposed Project will be conducted in areas that were previously disturbed during construction of the Proposed Project. As a result, it

is not anticipated that cultural and paleontological resources will be encountered during such activities, and there will be no cumulative impact.

Hazards and Hazardous Materials

Cumulative impacts to hazards and/or hazardous materials can result from the construction of concurrent projects and the Proposed Project having an increased effect on public or worker safety, including exposure to hazardous materials, increased fire potential, or physical hazards. The Proposed Project and three of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile could occur simultaneously. In addition, seven other projects do not have a defined timeline. As a result, several of these projects have the potential to result in a cumulative impact to overall hazards or hazardous materials when combined with the Proposed Project. Because each of these projects requires construction equipment, these projects have the potential to create a temporary impact from accidental releases of diesel and gasoline fuel, hydraulic fluids, and other hazardous liquids. While no impact is anticipated, there is a potential for accidental spills or leaks. Though this potential hazard will exist during construction, it is very unlikely that a spill will occur in the same immediate vicinity during a similar timeframe. Large releases of hazardous materials from multiple projects are highly unlikely with adherence to federal and state regulations. Small releases will be contained, cleaned up, and disposed of properly. As the nearest project that could be constructed during the Proposed Project's timeframe is approximately 0.11 mile away, the potential for accidental releases to result in a cumulative impact is low. As a result, a cumulative impact to hazardous materials is not anticipated.

Greenhouse Gas Emissions

The construction schedule for the Proposed Project and three of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile could occur simultaneously. In addition, seven other projects do not have defined construction timelines. A cumulative greenhouse gas (GHG) impact in the Proposed Project area could occur during construction of these projects. The vehicles and heavy equipment used during construction will be the primary sources of these emissions. However, emissions generated during Proposed Project construction will be negligible when compared to existing baseline GHG emissions in the area. SDG&E will be required to adhere to the standards and requirements established by the SDAPCD to minimize the potential for the Proposed Project's construction activities to contribute to potential cumulative impacts with regard to GHG emissions. The other projects in the area will also be required to adhere to the SDAPCD standards and requirements. As such, impacts will be reduced to a less-than-significant level and will not be cumulatively considerable.

During operation, various projects may potentially contribute to GHG accumulation by emitting carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Projects that will contribute to GHG accumulation generally include those that will induce population growth, such as condominium developments and hotels. The Proposed Project, on the other hand, will not contribute to this cumulative impact because SDG&E already operates and patrols facilities in the area. As a result, no cumulative impact will occur.

Hydrology and Water Quality

Cumulative impacts to hydrology and/or water quality have the potential to result from increases in local groundwater use and alterations to the existing and natural drainage patterns of the landscape. All of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile will be constructed in previously developed areas where there are no existing hydrological or natural drainage features. Pollutants or sediment disturbed during grading or construction could potentially enter the watershed and increase the potential for construction-related contaminants to reach surface water or groundwater. However, other planned or future projects within the cumulative study area will be required to conform to City of San Diego regulations and policies and/or the National Pollutant Discharge Elimination System General Construction Permit, which requires the implementation of best management practices to reduce potential construction-related (as well as long-term) impacts on hydrology and water quality to a less-than-significant level. As a result, a cumulative impact is not anticipated.

Noise

Construction of the Proposed Project and three of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile could occur simultaneously. Seven additional projects could also occur in the same timeframe, as their construction schedules are currently not defined. The simultaneous construction of these projects could result in a cumulative impact to overall noise levels when combined with the Proposed Project. The Proposed Project components are separated from the 401 West Ash Street Hotel Development Project by a distance of approximately 0.5 mile. The Pacific Highway Obstructed Curb Ramp Barrier Removal Project is located approximately 0.35 mile away, and construction will be limited in duration. While the San Diego County Airport North Side Development Project – Consolidated Car Rental Facilities Project will be located approximately 0.11 mile from the Proposed Project, these sites are separated by Pacific Highway and the San Diego International Airport to the west. At these distances and with the existing dominant noise sources in area (e.g., San Diego International Airport, railroad use, and I-5), it is unlikely that construction noise from simultaneous projects would be discernable at a sensitive receptor. The construction-related noise levels from the Proposed Project will not exceed the 75 A-weighted decibel threshold from the City of San Diego's Noise Ordinance. In addition, noise-sensitive receptors will not experience a significant increase in ambient noise during construction activities. Impacts will be less than significant due to the short-term nature of the construction phase of the Proposed Project, the existing transportation-related ambient noise sources in the area, and the generally industrial setting of the area. Therefore, the Proposed Project is not anticipated to contribute to a cumulatively significant noise impact.

Long-term operation of the proposed Vine Substation will not significantly increase noise levels beyond the noise levels that presently exist in the area, because surrounding land uses (e.g., San Diego International Airport) and several roadways (e.g., I-5, Kettner Boulevard and Pacific Highway) currently experience high-volume traffic and associated vehicle noise. As a result, the Proposed Project's contribution to a significant cumulative noise impact will be minimal and the cumulative impact will be less than significant.

Transportation and Traffic

During the construction phase, cumulative traffic impacts will occur from projects that have overlapping construction timeframes. In this case, the Proposed Project will potentially overlap with three of the projects listed in Table 4.18-1: Planned and Proposed Projects Within One Mile. Seven additional projects could also overlap with Proposed Project construction as their construction timelines are unknown. Traffic could be increased in the surrounding area during concurrent construction of these projects. Within the Proposed Project area, Vine Street, Sassafras Street, West Laurel Street, and West Hawthorn Street are local public streets that run east to west; and Kettner Boulevard, California Street, and Pacific Highway run north to south. During construction, Vine Substation will be accessible from Vine Street via the existing driveway. Lanes of travel within Kettner Boulevard will be limited during relocation of the 12 kV distribution circuits, which could impact the level of service (LOS) in the area. However, this work will be short-term in nature and will occur at night when vehicle traffic is at its lowest level. In addition, all of the roadways within the Proposed Project area are currently operating at acceptable LOS standards—with the exception of West Laurel Street.

Due to the locations of the other cumulative projects, it is unlikely there will be overlapping traffic resulting in significant cumulative traffic impacts. Given the small and limited nature of the Pacific Highway Obstructed Curb Ramp Barrier Removal Project, it is unlikely to have significant overlapping traffic associated with its construction. The 401 West Ash Street Hotel Development Project activities will have the potential to overlap with the Proposed Project. However, this project is located approximately 0.5 mile away on the northeast corner of Ash, Columbia, and State streets and will not likely utilize the same roads as the Proposed Project. Construction of the San Diego County Airport North Side Development Project has the potential to increase traffic to surrounding roadways. Access to this project will likely be provided by Washington Street, Pacific Highway, and Midway Avenue. As a result, it is unlikely that significant transportation and traffic-related impacts will occur as a result of this project, when combined with the Proposed Project. Construction of the Proposed Project is not expected to cause a significant impact because Proposed Project-generated traffic will be minimal, will occur over the course of the day, and will not result in an increase of the volume/capacity ratio to the point that a significant impact will occur, per the City of San Diego Traffic Impact Study Manual. For these reasons, the Proposed Project's contribution to transportation and traffic impacts will not be cumulatively considerable.

Permanent cumulative impacts are not anticipated as a result of the Proposed Project in combination with the other proposed projects. Operation of the proposed Vine Substation will generate approximately six trips per year by a two- to four-person crew and SDG&E already operates and maintains facilities in the vicinity of the substation. Therefore, a significant impact is not expected. For these reasons, the Proposed Project's contribution to transportation and traffic impacts will not be cumulatively considerable.

4.18.8 Conclusion

While the Proposed Project will contribute to certain cumulative impacts with the level of development activity in its vicinity, its contribution to these impacts is anticipated to be minimal. It is anticipated that the other projects within the vicinity of the Proposed Project will be required to implement avoidance and minimization measures similar to SDG&E's APMs, mitigation

measures, and permit conditions. These measures will minimize potential environmental impacts, thereby minimizing the overall cumulative effects. As a result, cumulative impacts are expected to be less than significant.

CHAPTER 5 – DETAILED DISCUSSION OF SIGNIFICANT IMPACTS

5.0 INTRODUCTION

In accordance with the Proponent's Environmental Assessment (PEA) Checklist issued by the California Public Utilities Commission (CPUC) on November 24, 2008, this Section:

- identifies the potentially significant impacts that would result from the construction, operation, or maintenance of the San Diego Gas & Electric Company (SDG&E) Vine 69/12 Kilovolt (kV) Substation Project (Proposed Project);
- discusses the alternatives that were evaluated in determining the Proposed Project and the justification for the selection of the preferred alternative; and
- discusses the Proposed Project's potential to induce growth in the area.

5.1 APPLICANT-PROPOSED MEASURES TO MINIMIZE SIGNIFICANT IMPACTS

Based on the findings in Chapter 4 – Environmental Impact Assessment, the Proposed Project is not likely to result in significant impacts to any resource areas after implementation of the applicant-proposed measures (APMs) and SDG&E's ordinary construction and operating restrictions. SDG&E has identified four APMs that it plans to implement during construction and/or operation of the Proposed Project to reduce or avoid impacts. Chapter 3 – Project Description provides the APMs that have been proposed as part of the Proposed Project, as well as the justification for each.

5.2 DESCRIPTION OF PROJECT ALTERNATIVES AND IMPACT ANALYSIS

5.2.0 Introduction

Section 15126.6, subdivisions (a) and (f)(2)(A) of the California Environmental Quality Act (CEQA) Guidelines and Assigned Commissioner's Ruling on Application 01-07-004 (dated October 16, 2002) do not require a review of alternatives when a project would not result in significant environmental impacts after mitigation, as is the case with the Proposed Project. However, the CPUC has adopted an "Information and Criteria List" in order to determine whether applications for projects are complete. The list specifies the information required from any applicant for a project subject to the CEQA. As the lead agency, the CPUC requires applicants for a Permit to Construct or a Certificate of Public Convenience and Necessity to describe a reasonable range of alternatives within the PEA.

This Section summarizes and compares the environmental advantages and disadvantages of the Proposed Project and the alternatives considered. In accordance with CPUC requirements, SDG&E evaluated a reasonable range of alternatives that meet most of the project objectives. Under the CEQA, the intent of analyzing project alternatives is to identify ways to mitigate or avoid the significant effects of the Proposed Project on the environment (Public Resources Code Section 21002.1). The discussion of alternatives only needs to focus on the alternatives to the

Proposed Project or the locations that are capable of avoiding or substantially decreasing the significant impacts of the Proposed Project.

This environmental alternatives analysis evaluates the No Project Alternative, five system or facility alternatives to the Proposed Project as a whole, and four alternative locations for the proposed Vine Substation. Route alternatives were not developed and analyzed as part of this process. The proposed 12 kV distribution relocation route represents the shortest distance between the existing facilities and the proposed Vine Substation, is located entirely within an existing roadway, and avoids traversing existing developed land uses. The 69 kV loop-in route also represents the shortest route that can be feasibly connected to the proposed Vine Substation while reducing the number of crossings over the existing railroad tracks and utilizing available franchise easements.

Each alternative is evaluated for its feasibility and ability to fulfill the Proposed Project objectives, as well as its ability to reduce environmental impacts compared to the Proposed Project. Figure 5-1: System Alternatives depicts each of the evaluated system alternatives. Figure 5-2: Alternative Substation Sites shows the location of each of the substation site alternatives on an aerial-based map. Table 5-1: Alternatives Considered lists each alternative that was considered during the alternatives evaluation process. All of the site alternatives are located in the downtown area of the City of San Diego. System alternatives that were clearly not feasible were rejected early in the evaluation process and are not discussed in detail in this document. Alternatives to the Proposed Project that were evaluated, including the No Project Alternative, are summarized in sections that follow. Feasible alternatives that were considered but eliminated because they did not meet the Proposed Project objectives or reliability requirements are discussed briefly in Section 5.2.5 Construct a New Substation Alternative.

5.2.1 Methodology

The CEQA does not provide specific direction regarding the methodology of alternatives comparison. Resource areas that are generally given more weight in comparing alternatives are those with long-term impacts, such as visual impacts, permanent loss of habitat, or land-use conflicts. Impacts associated with construction (i.e., temporary or short-term) or those that are easy to mitigate to a less-than-significant level are considered to be less important. In order to properly analyze each alternative, SDG&E followed the following three-step process:

1. SDG&E began by determining if each alternative is feasible; that is, they evaluated whether the requirements to build the alternative are reasonable, as defined in the CEQA Guidelines.

2. SDG&E then determined which alternatives attain all or a majority of the Proposed Project objectives.

3. Lastly, SDG&E evaluated the relative environmental impact of each site alternative for select resource areas. Even though the Proposed Project has no significant unmitigated impacts, SDG&E considered whether an alternative would reduce one or more impacts further than under the Proposed Project.

	County of San Diego Substation Site	Evaluated for Potential Environmental Impacts
	Adjacent to Urban Substation Site	Evaluated for Potential Environmental Impacts
	State Street Substation Site	Eliminated Prior to Environmental Review

The No Project Alternative and System Alternatives listed in Table 5-1: Alternatives Considered, were analyzed based on their ability to meet the engineering requirements and Proposed Project objectives. Because they did not meet all of the Proposed Project objectives, no further analysis was conducted. The Site Alternatives were analyzed based on their ability to meet the engineering requirements, then the Proposed Project objectives, and then the environmental constraints. This analysis resulted in the selection of a new 69/12 kV substation (Vine Substation), which is described in detail in Chapter 3 – Project Description.

5.2.2 Proposed Project Objectives

The Proposed Project is being proposed to meet several objectives identified by SDG&E. The overall objective of the Proposed Project is to construct a new substation and associated power line loop-in, and to relocate/re-arrange various distribution circuits. The Proposed Project is designed to eliminate existing reliability concerns at the Kettner Substation and to increase distribution system reliability in downtown and the surrounding area. In addition, the Proposed Project will ultimately provide 90 megavolt amperes (MVA) of additional capacity in its eventual configuration, which will provide a reliable solution for serving existing and future area

load and prevent potential long outages or disruption of service to existing and new customers in downtown and the surrounding area. Specifically, the Proposed Project has the following four objectives:

- Objective 1: Maintain existing substation and distribution system reliability standards.
- Objective 2: Provide substation and circuit tie capacity that will provide additional reliability for existing and future system needs.
- Objective 3: Meet the area's long-term electric distribution capacity needs by constructing a substation near planned load growth.
- Objective 4: Utilize existing SDG&E-owned land previously purchased for substation use to meet the scheduled in-service date.

Each of these Proposed Project objectives is more thoroughly described in Chapter 2 – Project Purpose and Need.

5.2.3 No Project Alternative

CEQA requires an evaluation of the No Project Alternative so that decision makers can compare the impacts of approving the Proposed Project with the impacts of not approving the Proposed Project (CEQA Guidelines, Section 15126.6(e)). Under the No Project Alternative, the proposed Vine Substation and 69 kV loop-in would not be constructed, and the various distribution circuits would not be relocated/re-arranged.

In providing electrical service to downtown and the surrounding area, SDG&E currently operates four substations—Kettner Substation, Urban Substation, Station B Substation, and Sampson Substation. Grant Hill Substation is an existing facility in the surrounding area that was also evaluated as a potential alternative to the Proposed Project in order to serve capacity needs. Commercial growth in downtown and the surrounding area is driving the existing substations to their ultimate capacities. Because the projected load indicates that all substations in downtown and the surrounding area will exceed 85 percent of their capacity by 2018, SDG&E has determined that an additional 30 megavolt-amperes (MVA) is needed by mid-2017 to serve this growth. The optimum maximum substation load is 85 percent, as it allows for transformer bank loads to be transferred in the event of a transformer bank outage. Optimum operating conditions maintain substation reliability and reduce outage times. All of the substations—with the exception of Grant Hill and Sampson substations—are near capacity and will begin to exceed their 85-percent ratings in 2015 or sooner. Grant Hill Substation has ultimate capacity remaining; however, this substation is not optimal for providing additional capacity due to its distance from downtown and the surrounding areas. In addition to the existing customer-driven growth in downtown and the surrounding area, expansion of San Diego International Airport and construction of Ballpark Village—a new mixed use development consisting of apartments, condominiums, and commercial and retail space—is expected to commence construction at the end of 2015.

The No Project Alternative will not meet any of the Proposed Project's objectives. The No Project Alternative will not address the reliability concerns at the Kettner Substation and will not provide the additional 30 MVA of capacity to offload the congested downtown and surrounding area substations. The No Project Alternative will also not provide the opportunity to maintain

substation and circuit reliability with added tie capacity. In addition, if the No Project Alternative was selected, a new substation will not be available to meet increased capacity needs driven by commercial growth in the area.

5.2.4 System Alternatives

Alternatives were examined for correcting the projected system overloads and reliability deficiency in the downtown and surrounding service area. The following five system alternatives were considered but rejected as preferred to substation construction, as described in the subsections that follow.

Rebuild and Expand Kettner Substation Alternative

SDG&E evaluated the expansion of Kettner Substation—an aging facility with obsolete equipment. The location of the Kettner Substation is depicted in Figure 5-1: System Alternatives. The Kettner Substation has a variety of reliability concerns due to its physical layout and aging infrastructure. Given its current state, without significant repair these concerns will likely become an operational/security/safety issue.

Due to space constraints at the Kettner Substation, acquisition of an adjacent approximately 0.25-acre parcel would be required to address some of the current reliability issues on site, including the rebuild of the existing control shelter and repair of the perimeter fence line. Even with the purchase of the adjacent parcel, the expanded site will not have enough space to install an additional transformer. By failing to add capacity at this site, the substation will continue to operate near its ultimate capacity, which will not address the future load needs of downtown and the surrounding area. As a result, this system alternative was not selected as preferred.

Expand Sampson Substation Alternative

Sampson Substation is located south of downtown San Diego in the community of Barrio Logan, as depicted in Figure 5-1: System Alternatives. SDG&E evaluated expansion or upgrade of this substation to avoid projected system overloads in the service planning area; however, this substation is already built out to its ultimate capacity and due to the limited size of the parcel (0.75 acre) it lacks available space within its existing footprint to accommodate further expansion. Due to the surrounding commercial uses, it is not feasible to expand the Sampson Substation. As a result, this system alternative was eliminated from further consideration.

Expand Station B Substation Alternative

Station B Substation is located south of Broadway along Kettner Boulevard, as shown in Figure 5-1: System Alternatives. The Station B Substation site is too small (0.83 acre) to accommodate an additional transformer and there is no available space to expand the substation within its existing footprint. Therefore, this substation cannot be expanded or upgraded to avoid projected system overloads in the service planning area because they are all built out to their maximum configurations. In addition, the site is surrounded by existing commercial uses that would make acquiring additional adjacent property infeasible. As a result, this system alternative was not selected as the Preferred Project.

Expand Urban Substation Alternative

Urban Substation is located north of Market Street, between F and G Street, as depicted in Figure 5-1: System Alternatives. SDG&E determined that Urban Substation—currently fed by two power lines—could accommodate a fourth bank; however, this would require the addition of a new third power line, which would be very challenging due to required reconfiguration of the 69 kV portion of the existing substation. Reconfiguration of this portion of the existing substation will require taking portions of the substation out of service, which would have the potential to reduce customer reliability. Further, this site is already serving 14 distribution circuits and can only accommodate one additional distribution circuit, with the addition of another transformer. This is not considered an optimum configuration. As a result, this alternative would not completely address distribution capacity needs. In addition, the City of San Diego has raised concerns in the past about the location of this substation and its desire to have it either relocated or undergrounded to eliminate visual impacts to the surrounding community. As a result, this alternative was determined to be infeasible and was eliminated from further consideration.

Expand Grant Hill Substation Alternative

Grant Hill Substation is the only substation that can accommodate additional distribution capacity. Grant Hill Substation is located east of Interstate 5, south of State Route 94 on 30th Street in the community of Grant Hill, as shown in Figure 5-1: System Alternatives. The Grant Hill Substation was built to accommodate the east downtown area and is located outside of the desired coverage area. Consequently, adding additional circuits to this substation would require long distribution circuits—thereby decreasing efficiency of the system. In addition, upgrades to the substation for purposes of downtown and the surrounding area would be detrimental to the east downtown area, should the area ever require additional capacity. As a result, this system alternative was eliminated from further consideration.

5.2.5 Construct a New Substation Alternative

After evaluating several alternatives that would upgrade existing substation facilities, SDG&E determined none of the existing substations in downtown and the surrounding area can be expanded or upgraded to correct the projected system overloads and reliability deficiency in the downtown and surrounding service area. Therefore, SDG&E determined that it was necessary to investigate potential sites for the construction of a new distribution substation in this service area. The following section discusses the alternative substations sites that were evaluated.

Substation Site Alternatives

A total of five substation sites were initially considered for construction of the proposed Vine Substation. These potential substation sites are depicted in Figure 5-2: Alternative Substation Sites. Two of these substation sites—State Street and Hillcrest—were determined to be too small (0.7 acre and 0.3 acre, respectively) and narrow to maintain the required operation and maintenance clearance around the substation equipment and to accommodate the connection of power lines. In addition, the State Street site was too narrow in configuration to accommodate a

substation. The remaining three sites were evaluated based on the following differentiating criteria in order of importance:

- Engineering Factors
  - Parcel size (minimum 1 acre) and of appropriate shape
  - Close proximity to existing power lines
- Ability to meet the Proposed Project objectives
- Ability to secure the parcel in accordance with schedule constraints
- Environmental Constraints
  - Potential visibility from residences and recreational areas, based on proximity
  - Potential for land use conflicts

From these three alternatives, a preferred substation location was determined based on these criteria.

Vine Substation Site – Preferred Site

The proposed Vine Substation site is a 1.5-acre parcel located at the southwestern corner of the intersection of Vine Street and Kettner Boulevard, just west of Interstate (I-) 5 and east of Pacific Highway. An existing overhead power line is located adjacent to and to the west of the site. The site will allow SDG&E to meet all of the Proposed Project objectives. The site is owned by SDG&E and was previously being leased for long-term airport parking, thus there is no schedule constraint associated with site acquisition. The site is designated Industrial Employment; thus, the use is consistent with the General Plan, though substations in this designation are not explicitly discussed. The parcel is bordered to the north by Vine Street and a commercial printing business across Vine Street, to the south by an Advantage Rental Car facility, to the east by Kettner Boulevard, and to the west by the North County Transit District Coaster and San Diego Metropolitan Transit System Trolley rail tracks. Views toward the site from the residential neighborhood of Midtown are almost completely blocked by the Interstate 5 embankment as well as by the closely spaced buildings and mature vegetation lining the streets of this residential neighborhood. Thus, the proposed Vine Substation site was selected as the preferred site because it meets the engineering criteria, meets all of the Proposed Project objectives, is already owned by SDG&E, and does not result in any environmental impacts that exceed those of the alternatives. A detailed analysis of this site is provided in Chapter 4 – Environmental Impact Assessment.

County of San Diego Substation Site

The site is 1.23 acres, located along Kettner Boulevard, approximately 600 feet from an existing SDG&E power line, as depicted in Figure 5-2: Alternative Substation Sites. The site is comprised of six developed parcels owned by the County of San Diego. Construction of a substation at this site would require an underground power line crossing of the North County Transit District Coaster and San Diego Metropolitan Transit System Trolley rail tracks. Due to the number of parcels that would need to be acquired, this alternative is not considered feasible from a schedule perspective. This alternative would also be visible from residences located directly across from the site on Kettner Boulevard. In addition, existing uses on the site consist of industrial warehouses and a parking lot, thus existing businesses would need to be removed to accommodate a new substation. For these reasons, the site was not considered environmentally superior to the Proposed Project site.

Near Urban Substation Site

Two parcels located adjacent to the existing Urban Substation, as shown in Figure 5-2: Alternative Substation Sites, were evaluated as potential sites for a new substation. Construction of a substation at these sites would require approximately four to five blocks of underground construction to accommodate the interconnection of at least one new 69 kV line. The 0.23-acre parcel located immediately adjacent to the existing Urban Substation is owned by the City of San Diego. The other parcel, which is 0.25-acre in size and located further east, is owned by a private entity. Historically, the City has opposed the location of a substation within the community. Therefore, the City would be unlikely to sell this site to SDG&E for a substation, greatly affecting acquisition time. For these reasons, the site is not considered environmentally superior to the Project site.

5.2.6 Conclusion

A number of alternative system development approaches and site locations for the Proposed Project were evaluated against the Proposed Project objectives to provide continued service to downtown and the surrounding area. The No Project Alternative, Rebuild Kettner Substation Alternative, Expand Sampson Substation Alternative, Expand Station B Substation Alternative, Expand Urban Substation Alternative, and Expand Grant Hill Substation Alternative were evaluated and rejected based upon their inability to meet Proposed Project objectives and engineering design requirements.

With regard to the alternative sites that were evaluated, Table 5-2: Alternative Site Comparison Summary, identifies the relative differences between the sites based on the identified criteria. Many of these sites do not meet the minimum land area and shape requirement criteria or would require the extension of power lines outside of the existing ROW, resulting in increased land requirements or greater construction impacts than would result from the Proposed Project. SDG&E would not be able to acquire many of the sites according to the Proposed Project schedule. Many of the sites would also have environmental impacts that would exceed those of the Proposed Project. Each of the alternatives failed to meet basic Proposed Project objectives. The proposed Vine Substation site, by comparison, meets the engineering criteria, meets all of the Proposed Project objectives, is already owned by SDG&E, and does not result environmental impacts that exceed those of the alternatives. Thus, the proposed Vine Substation site was selected as the preferred substation site.

5.3 GROWTH-INDUCING IMPACTS

5.3.0 Growth-Inducing Impacts

The CEQA requires a lead agency to review and discuss ways in which a project could induce growth. The CEQA Guidelines (Section 15126.2d) consider a project to be growth-inducing if it fosters economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding area. New employees hired for proposed commercial and industrial development projects and population growth resulting from residential development projects represent direct forms of growth. Other examples of growth-inducing projects are the expansion of urban services into previously undeveloped areas or the removal of major obstacles to growth, such as transportation corridors and potable water supply.

Table 5-2: Alternative Site Comparison Summary

Criteria		Substation Site Alternatives		
		Vine Substation (Preferred/Proposed Project)	**County of San Diego**	**Near Urban**
Engineering Requirements	Approximate Proximity to Existing Power Line (feet)	Immediately adjacent	600	6,500
	Size (acres)	1.5	1.2	0.25 and 0.22
Number of Project Objectives Met		4	2	2
Land Rights	Ability to secure the parcel in accordance with schedule constraints	Good, SDG&E owned	Poor, many parcels	Poor, unwilling seller
Environmental Requirements	Proximity to residences and recreational areas	None	Many	Many
	Potential for land use conflicts	None	Yes, currently developed	None

The growth-inducing potential of the Proposed Project could be considered significant if it were to stimulate human population growth or a population concentration in the City of San Diego or other surrounding communities, above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Significant growth impacts could also occur if the Proposed Project were to provide infrastructure or service capacity to accommodate growth levels beyond those permitted by local or regional plans and policies. Because the Proposed Project will not increase housing, bring in new services, or improve the existing infrastructure system (with the exception of making the existing electric service more reliable and adding additional capacity to accommodate planned growth), it will not stimulate population growth or result in a new concentration of residents, businesses, or industries.

5.3.1 Growth Caused by Direct and Indirect Employment

The construction and operation of the Proposed Project itself will not affect employment patterns in the area. SDG&E will employ an average of approximately 33 workers throughout the 19-month-long construction period. During the peak construction period, up to 63 workers may be employed. The workers will consist of existing SDG&E employees and contract workers. The majority of construction workers are anticipated to come from San Diego County and will not require lodging.

Operation and maintenance of the Proposed Project will be performed by current SDG&E employees and will, therefore, not create new jobs. Because the Proposed Project will not result in an increase in employment during the operation and maintenance phase, the Proposed Project will not increase the demand for new housing.

5.3.2 Growth Related to the Provision of Additional Electric Power

The population of San Diego County has increased every year since 1944. As a result, growth is part of the past, present, and expected future of the region. The San Diego Association of Governments (SANDAG) is the regional planning entity for the San Diego region and is composed of representatives from 18 cities and the county government. SANDAG serves as the forum for regional decision-making. SANDAG makes strategic plans, obtains and allocates resources, and provides information on a broad range of topics pertinent to the region's quality of life.

The cities and county have designated SANDAG as the regional planning board, pursuant to a voter-approved proposition. The cities and county provide SANDAG with information about their general plans, local growth patterns, and land use regulations. In return, SANDAG generates regional management plans and population forecasts. As members of SANDAG, the cities and county review and approve all plans and forecasts prepared by SANDAG. The cities and county use SANDAG's findings to develop and shape their respective general plans and land use regulations. The county and each city are required to adopt a general plan, which must be updated on a regular basis. All general plans and subsequent amendments are subject to CEQA review.

SANDAG prepared a Regional Comprehensive Plan (RCP) in 2004 to provide policy guidance on accommodating the growth projected by SANDAG. A key element of the RCP is the Integrated Regional Infrastructure Strategy (IRIS), which outlines guidance for planning the

region's infrastructure. The goal of the IRIS is to ensure internal consistency with respect to long-term regional infrastructure planning to meet the needs of the growth projected by SANDAG. The IRIS addresses the energy supply and delivery system as key infrastructure elements. As the primary utility that provides electric service to approximately 3.4 million people using approximately 1.4 million meters in its service area, which includes all of San Diego County and the southern part of Orange County, SDG&E participates in and supports this aspect of the planning process. SANDAG has been preparing long-range forecasts of population, housing, and employment since the 1970s. SANDAG's forecasts represent the changes anticipated for the region based on the best available information. The forecast is produced by using established computer models that evaluate land use, demographics, regional and local economics, and transportation patterns. The SANDAG forecasts utilize a complex set of assumptions, input data, computations, and model interactions.

The latest Regional Growth Forecast (RGF) was developed for 2050 and provides an update of expected growth from the previous model that was developed for 2030. The 2050 RGF is based on data from the 2008 estimate produced by the California Department of Finance plus updated information for all model inputs.

The 2050 RGF predicts that economic and local population will continue at a steady rate through 2050, although at a slightly slower rate than in the previous 40 years. These updated projections suggest that the region will approach 4.4 million residents, 1.9 million jobs, and 1.5 million housing units by 2050.

SANDAG does not use energy as a driver of growth; however, its regional growth model recognizes the investment in energy infrastructure as necessary to support the implementation of the RCP. SDG&E coordinates with SANDAG to address this component of its regional planning process. Only local government entities with jurisdiction over land use approvals can either directly cause or prevent growth. How and where development occurs within SDG&E's service area is dictated by the land use agencies with this authority. SDG&E responds to such development.

5.3.3 Proposed Project and Growth

The objectives of the Proposed Project are to maintain existing reliability standards for the distribution and substation systems, provide substation and circuit tie capacity that will provide additional reliability for existing and future system needs, meet long-term electric distribution capacity needs by constructing a substation near planned load growth, fulfill long-term electric distribution capacity needs by constructing a substation near planned load growth, and to meet project need while minimizing environmental impacts. The Proposed Project will provide additional capacity to serve existing and future area load and to prevent potential long outages or disruption of service to existing and new customers in downtown and the surrounding area. Furthermore, the Proposed Project will not create a new service or source of power that will indirectly allow for an increase in population or housing as a result, as it will not extend infrastructure into previously un-served areas.

The Proposed Project will accommodate existing and planned power demands in SDG&E's service territory, as well as those based on state- and locally adopted plans and projections.

SDG&E responds to projected development and forecasts, rather than inducing growth by extending infrastructure for future unplanned development. Therefore, the Proposed Project will not induce population growth in the area.
