**PREPARED DIRECT TESTIMONY OF
JOSEPH PASQUITO
ON BEHALF OF SDG&E**

I. INTRODUCTION

This testimony presents San Diego Gas & Electric Company's ("SDG&E") compliance with least-cost dispatch ("LCD") requirements during the record period of January 1, 2019 through December 31, 2019, as specified by applicable California Public Utilities Commission ("Commission") decisions. LCD pertains to the day-ahead and intra-day dispatch and trading of SDG&E's portfolio of resources, including utility-owned generation ("UOG") and power purchase agreements ("PPA"). The following summarizes Commission decisions on LCD and how SDG&E implemented these decisions in a manner consistent with its current Commission-approved Bundled Procurement Plan ("BPP").¹

Standard of Conduct 4 ("SOC 4") was adopted by the Commission in D.02-10-062 and further discussed in D.02-12-069, D.02-12-074, D.03-06-076, and D.05-01-054. The decisions established standards of conduct by which an IOU must administer its portfolio, specifically SOC 4, which states that "[t]he utilities shall prudently administer all contracts and generation resources and dispatch the energy in a least-cost manner."²

During 2019, SDG&E filed four quarterly advice letters ("AL") covering the record period as required in D.02-10-062. AL 3371-E for Q1 2019 was approved on October 15, 2019 and was effective May 30, 2019; AL 3411-E for Q2 2019 was approved on January 3, 2020 and was effective August 29, 2019; AL 3456-E for Q3 2019 is pending approval with a requested effective date of December 2, 2019; and AL 3502-E for Q4 2019 is pending approval with a

¹ For purposes of the Commission's review and the compliance findings requested herein, the relevant BPP is SDG&E's 2014 BPP, approved by the Commission and in compliance with Decision ("D.") 15-10-031.

² D.02-10-062 at 52 and Conclusion of Law ("COL") 11 at 74.

1 requested effective date of March 2, 2020. These advice letters provide detailed information on
2 transactions that SDG&E executed while following its LCD process, as well as other data (*e.g.*,
3 customer load, resource schedules and fuel transactions) pertinent to the LCD process during the
4 record period. SDG&E’s Quarterly Compliance Reports (“QCRs”) for 2019 were in compliance
5 with SDG&E’s Commission-approved BPP and applicable procurement-related rulings and
6 decisions.

7 **II. SDG&E’S COMPLIANCE SHOWING**

8 SDG&E testimony and attachments will demonstrate compliance with LCD based on
9 applicable regulatory requirements, notably D.15-05-005 (the “Decision”) and D.18-10-006
10 (“Decision Approving Settlement Between San Diego Gas & Electric Company and the Office
11 of Ratepayer Advocates”).³

12 **A. SDG&E Showing is in Accordance with D.15-05-005**

13 Based on the Decision, SDG&E’s testimony will include the following:

- 14 • Overview/narrative of LCD in the California Independent System
15 Operator (“CAISO”) markets
- 16 • Description of SDG&E’s bidding and scheduling processes
- 17 • Summary of reports/tables documenting aggregated annual exceptions for:
 - 18 ○ Incremental cost bid calculations
 - 19 ○ Self-commitment decisions
 - 20 ○ Master File data changes

³ The Office of Ratepayer Advocates has been renamed as the California Public Advocates Office (hereinafter referred to as “Cal PA”).

- 1 • Narratives reviewing significant strategy changes, internal software and/or
2 process changes and CAISO market design changes during the record
3 period.
- 4 • A background summary table outlining baseline annual data, including:
 - 5 ○ Total capacity of the dispatchable (bid in) portfolio
 - 6 ○ Total dispatchable capacity lost due to planned or forced outages
 - 7 ○ Total capacity of non-dispatchable (exclusively self-scheduled)
8 portfolio
 - 9 ○ Total non-dispatchable capacity lost due to planned or forced
10 outages
 - 11 ○ Total Energy awards (dispatchable and non-dispatchable by
12 resource type and broken down by self-scheduled versus market
13 awards)
- 14 • Demand Response (“DR”) metrics will be provided for dispatchable DR
15 programs with economic triggers including the following:
 - 16 ○ Capacity Bidding
 - 17 ○ AC Saver
 - 18 ○ Annual Summary of results reporting requirement related to dispatch of
19 DR resources including when all programs were dispatched and an
20 explanation of when DR resources could have been dispatched but were
21 not.
 - 22 ○ Calculation of the number of hours when the utility forecasts that trigger
23 criteria will be reached, as a percentage of hours in which the trigger
24 conditions were reached in the same period.

- 1 ○ Total energy actually dispatched as a proportion of maximum available
- 2 energy for each DR program broken down monthly and annually.
- 3 ○ Explanation as to why a DR resource was not dispatched despite its
- 4 maximum availability.
- 5 ○ Cost impact on overall resource dispatch of not calling DR programs up to
- 6 their maximum available amounts when program was forecasted to be
- 7 triggered.
- 8 ○ Consideration of whether the selection of the DR events called minimized
- 9 overall portfolio cost of dispatching supply resources.
- 10 ○ Explanation of SDG&E's opportunity cost methodology and
- 11 demonstration of its application during the Record Year.

12 **B. SDG&E's LCD Showing is in Accordance With the SDG&E/Cal PA's**
13 **Settlement⁴**

14 As in last year's testimony and in accordance with the Settlement mentioned above, this
15 testimony will include the following:

- 16 ○ Settlement Provision 1.2: Reasons in Attachment F- Master File Change
- 17 exceptions for selecting proxy or registered costs. See Section VI. of
- 18 testimony, below, and Attachment F.
- 19 ○ Settlement Provision 1.3: Calculations for determining whether a
- 20 discretionary self-schedule has a cost impact. See Section VI. below and
- 21 Attachments D and E.

⁴ See D.18-10-006.

- 1 ○ Settlement Provision 1.4: Detailed explanation of the unique operating
2 characteristics and parameters related to SDG&E’s hydro resource
3 scheduling. See Section IV. below and Attachment L.
- 4 ○ Settlement Provision 1.5: Report instances in which the locational
5 marginal price (“LMP”) is greater than the bid price but no dispatch was
6 awarded. See Section VI. below and Attachment C.
- 7 ○ Settlement Provision 1.6: Identify in testimony, on a month-to-month
8 basis, which dates the Demand Response Programs were unavailable, and
9 therefore not dispatched, due to a lack of nominations from the
10 aggregators. See Section X. below and Attachment H-K.

11 **C. SDG&E’s Independent Evaluation of Load and Price Forecasting**

12 As part of the aforementioned settlement, SDG&E agreed to “review the public version
13 of PG&E’s independent consultant’s report agreed upon in the PG&E record period 2014 ERRRA
14 Compliance Review settlement between PG&E and [Cal PA].”⁵ After review, SDG&E directed
15 an evaluation to be conducted on its 2019 load and price forecasting process. The evaluation is
16 being conducted by Dr. Derek Bunn of the London Business School.

17 **III. SDG&E PORTFOLIO OVERVIEW**

18 For the record period, most of SDG&E’s energy requirements were met with SDG&E
19 PPAs and UOGs. SDG&E’s PPAs included qualifying facility (“QF”) contracts and contracts
20 for renewable energy, dispatchable generation and out-of-state resources, all of which are
21 described in the Direct Testimony of SDG&E witness Miguel Duran. SDG&E’s UOG
22 assessment included combined-cycle (“CC”) plants, combustion turbines (“CT”) generators, and
23 non-generating resources (“NGRs”) such as energy storage batteries.

⁵ D.18-10-006, October 11, 2018.

1 The tables below provide summary data for resources in SDG&E’s portfolio as of
 2 January 1, 2019. The must-take resources in Table 1a are non-dispatchable; SDG&E has an
 3 obligation to accept the generation that is produced from these resources without regard to
 4 variable cost and therefore are exempt from SDG&E’s LCD process described in this testimony.
 5 The total of their generation in part determines SDG&E’s net long or short position, which did
 6 factor into LCD. The resources in Table 1b are dispatchable and were therefore the focus of
 7 SDG&E’s least-cost process during the record period. The “Capacity” column in Tables 1a and
 8 1b below are derived from CAISO Master File Resource Data Template (“RDT”) maximum
 9 capacities for resources where SDG&E is the scheduling coordinator (“SC”) and contract
 10 capacities for resources where SDG&E is not the SC.

11 **Table 1a: Must-Take, Wind, Solar Resources**

Resource	Contract MW	Dispatch Profile	Ancillary Service Capability
QF contracts (Natural Gas)	31	Baseload As-Available	None
QF Renewable	2	Intermittent As-Available	None
Renewable non-intermittent resources	41.4	Baseload (as available)	None
Renewable Intermittent Resources	2119 (maximum)	Intermittent	None

1 **IV. OVERVIEW OF LEAST-COST DISPATCH IN CAISO MARKETS**

2 On April 1, 2009, following Federal Energy Regulatory Commission (“FERC”) approval
3 of its market redesign application, the CAISO implemented the Market Redesign Technology
4 Upgrade (“MRTU”) now simply referred to as the “Market”, which introduced fundamental
5 changes in the way resources are committed and dispatched. The most significant of these
6 changes was the implementation of a centralized energy market which requires load-serving
7 entities (“LSEs”) to procure energy and ancillary services (“A/S”), and generators to sell energy
8 and A/S, through the CAISO markets based on self-schedules and economic bids.

9 The CAISO established a centralized spot market that enables all resources, through
10 standardized bidding and scheduling rules, to be competitively dispatched based on costs to serve
11 total system load, subject to operational and transmission constraints. These resources are not
12 matched up to any particular LSE’s load; LSEs now meet their needs by self-scheduling or
13 bidding for energy in the CAISO market. However, LSEs may rely on bilaterally procured
14 resources to hedge the day-to-day cost of buying energy and A/S from the CAISO markets, to
15 the extent these contracted resources pass on the revenues for energy and A/S awards received
16 from those same CAISO markets back to the LSE.

17 SDG&E periodically revises and improves its LCD processes to meet tariff rules and
18 operating requirements while maintaining compliance with SOC 4, particularly with regard to
19 self-schedules, convergence bids and economic bids for its dispatchable resources. These self-
20 schedules and bids for dispatchable units must accurately reflect variable costs to enable the
21 CAISO market to produce energy and A/S awards for SDG&E’s resources that are consistent
22 with LCD. SDG&E utilizes a cross-validation procedure for bids to ensure the accuracy of its
23 resource bids with respect to cost and the accuracy of its self-schedules in the CAISO market.

1 The CAISO market solves for the least-cost unit commitment and dispatch solution
2 incorporating self-schedules and economic bids from generators and load which takes into
3 account resource operational characteristics and constraints, resource and transmission outages,
4 impact of convergence bids, inter-temporal constraints and the effect of adjacent balancing
5 authorities impacted by the CAISO system. It is important to note that CAISO is solving for the
6 lowest system cost, not the highest revenue for a resource; therefore, looking at a resource's
7 awards in isolation may not yield expected results. If a resource is awarded in a manner below
8 their costs for a given 24-hour period, the resource may qualify for bid cost recovery ("BCR").
9 The nodal ("Pnode") market prices explicitly account for the economic effects of re-dispatching
10 resources to relieve congestion constraints.

11 The CAISO optimizes the dispatch of the several hundred generators across its system to
12 find the overall lowest-cost mix of resources to meet CAISO system load requirements
13 (including those of SDG&E). The CAISO market also co-optimizes the allocation of
14 dispatchable capacity between generation and A/S capacity, based on prices submitted for each
15 of these services in the resource bids.⁶ The resulting allocation of awards between generation
16 and A/S across the system therefore reflects the economic tradeoff between capacity used for
17 generation and what is reserved for A/S.

18 The CAISO employs an iterative mixed-integer programming methodology to account
19 for the numerous constraints cited above. A technical bulletin published by the CAISO describes
20 in greater detail its LCD optimization processes with respect to the IFM ("Integrated Forward
21 Market"). Specifically, Section 2.3 states:

⁶ For example, if a generator's energy bid price is \$10/MWh in-the-money relative to the clearing price, then the IFM may award the generator an A/S award only if the A/S clearing price exceeds \$10 or the generator's bid, whichever is greater.

1 The SCUC [Security Constrained Unit Commitment] engine determines optimally
2 the commitment status and the Schedules of Generating Units as well as
3 Participating Loads and Resource-Specific System Resources.

4 ***The objective is to minimize the Start-Up and Minimum Load costs and bid in***
5 ***Energy costs and Ancillary Services, subject to network as well as resource***
6 ***related constraints over the entire Time Horizon***, e.g., the Trading Day in the
7 IFM. The time interval of the optimization is one hour in the DAM and 5 or 15
8 minutes in the RTM depending on the application.

9 In IFM the overall production (or Bid) cost is determined by the total of the Start-
10 Up and Minimum Load Cost of CAISO-committed Generating Units, the Energy
11 Bids of all scheduled Generating Units, and the Ancillary Service Bids of
12 resources selected to provide Ancillary Services. ***This objective leads to a least-***
13 ***cost multi-product co-optimization methodology that maximizes economic***
14 ***efficiency, relieves network Congestion and considers physical constraints.*** The
15 economic efficiency of the market operation can be achieved through a least cost
16 resource commitment and scheduling with co-optimization of Energy and
17 Ancillary Services.⁷

18 A feature of the CAISO market is the ability for market participants to submit
19 self-schedules rather than economic (or price) bids for load and generation. A self-schedule is a
20 price-taker bid that is awarded, regardless of the Pnode clearing price (even if negative), subject
21 to operational constraints. SDG&E submits a self-schedule for its forecasted load in the Day
22 Ahead Market (“DAM”). SDG&E also submits self-schedules for its (non-intermittent
23 resources) must-take resources in the DAM.⁸ This approach is needed because SDG&E has an
24 obligation to receive energy from these resources, regardless of the market price, and self-
25 scheduling in the DAM ensures that revenues paid to these resources effectively offset costs
26 charged to SDG&E load.

27 Generally, self-schedules do not support the least-cost objective if a resource is capable
28 of responding to price signals. As described earlier, self-schedules are price-taker bids which

⁷ California ISO, Technical Bulletin 2009-06-05: Market Optimization Details (November 19, 2009) at 2-8 – 2-9 (emphasis added), available at <http://www.caiso.com/Documents/TechnicalBulletin-MarketOptimizationDetails.pdf>.

⁸ For brevity, this prepared direct testimony does not distinguish between SDG&E or the resource owner performing the Scheduling Coordinator functions for SDG&E’s resources.

1 may provide no assurance that market revenues will pay for fuel and other operating costs, and
2 thereby may expose SDG&E ratepayers to unnecessary risk of losses. Furthermore, self-
3 schedules could affect the CAISO's ability to optimally procure energy and A/S which are
4 necessary for grid reliability. Operational constraints will at times make self-scheduling
5 preferable to cost based bids.

6 Consequently, SDG&E primarily submits cost-based price bids for its dispatchable
7 generation rather than self-schedules. Under CAISO market rules, cost-based bids provide
8 SDG&E ratepayers a means to recover variable costs associated with start-up, minimum load and
9 dispatch from the market. Moreover, price bids enable the CAISO to perform its co-optimization
10 between energy and A/S awards.

11 Finally, with respect to LCD, price bids allow for CAISO market results to meet the
12 least-cost dispatch solution across the entire system, including SDG&E's service territory,
13 because the CAISO selects the mix of resources with the lowest total variable cost (as
14 represented by their price bids) to meet load requirements. To the extent SDG&E submits cost-
15 based price bids reflecting variable costs per D.02-09-053, and most accurately represents
16 operational parameters and constraints to the CAISO, the results produced by the CAISO
17 markets for SDG&E's supply portfolio are consistent with the Commission's LCD requirements.

18 **V. LEAST-COST DISPATCH SCHEDULING AND BIDDING PROCESS**

19 SDG&E's LCD process is managed by SDG&E's Energy Supply and Dispatch Group
20 ("ES&D"). Key personnel involved in daily LCD activity in the 2019 record period included
21 fuel traders and schedulers, power traders, day-ahead (pre)schedulers and real-time transaction
22 schedulers and analysts. The LCD process consisted of numerous functions, which are described
23 in this section.

1 **A. Pre-Day-Ahead Planning**

2 During the record period, LCD forecasts for a particular delivery date began with a
3 weekly production cost model that optimized resources to serve SDG&E’s load requirement for
4 the following 12-day period. The model software (“GenTrader”)⁹ was set up with numerous
5 parameters, including load forecast, plant operating data, resource availabilities/outages,
6 forecasted Locational Marginal Pricing (“LMP”) prices for all relevant pricing points and
7 dispatch constraints which allowed the model to perform complex analysis to produce a
8 preliminary forecast of generation dispatch and market transactions that minimized total cost to
9 serve the forecasted load requirement. The GenTrader model produced expected utilization of
10 resources for the planning horizon, including dispatch levels, fuel requirements and market
11 transactions. A detailed description of the inputs to GenTrader which SDG&E used for
12 determining an LCD forecast is as follows:

- 13 1. Load forecasts: SDG&E produced load forecasts using a load forecasting model
14 developed by Pattern Recognition Technologies, Inc. (“PRT”). The PRT model
15 utilizes multiple AI technologies such as artificial neural networks, fuzzy logic,
16 genetic algorithms, and evolutionary computing,¹⁰ and special proprietary
17 algorithms analyzed relationships between historical system load and weather
18 data to develop the load forecast for SDG&E’s system. SDG&E’s load forecast

⁹ SDG&E uses GenTrader, a production cost and optimization software application produced by Power Costs Inc. (“PCI”). GenTrader employs an optimization algorithm to calculate the optimal, constraints-bound mix of market transactions and generation from SDG&E’s resource portfolio over the study period. SDG&E acquired GenTrader as part of a PCI product suite in preparation for the new Market. PCI introduced GenTrader in 1999 and continues to implement modeling and technology enhancements that SDG&E receives under its license agreement. GenTrader is used by other clients across the country in nodal and traditional markets to optimize generation portfolios. Additional product description is available at PCI, Speeding Decisions, Optimization & Analytics, *available at* <http://www.powercosts.com/solutions/optimization-analytics/>.

¹⁰ As defined by Drilling Info, Future Technology Today, Ensemble of Adaptive Intelligent System Models, *available at* <http://www.prtforecast.com/technology/>.

1 for bundled customers was determined by adjusting SDG&E's system load for
2 transmission losses, accounting for rooftop solar production which fluctuates and
3 were calculated as a percentage estimate of the forecasted system load based on
4 historical data, less the load forecast for Direct Access customers and Community
5 Choice Aggregation (CCA) customers. Direct Access and CCA load forecasts
6 were provided by SDG&E's Electric Load Analysis group based on the historic
7 load for current Direct Access and CCA accounts in the SDG&E billing system.
8 These load forecasts were produced weekly as inputs to the GenTrader 12-day
9 LCD forecast.

- 10 2. Master File Updates and Operating constraints: The GenTrader model also
11 required a variety of cost inputs for each dispatchable resource to properly
12 determine its dispatch cost. The Master Files included a subset of data accessible
13 by the resource's scheduling coordinator which is referred to as the Resource Data
14 Template ("RDT"). SDG&E periodically submitted master file changes via an
15 RDT update process that was validated by CAISO. Such data included but was
16 not limited to heat rates, ramp rates and variable operation and maintenance costs
17 ("VOM"), minimum and maximum operating points, fuel delivery charges and
18 start-up and minimum load costs. In addition, numerous operating
19 constraints/parameters, included in the RDT, were also fed into the model
20 including start-up time, minimum shutdown and run times, multi-stage generation
21 ("MSG") transitions and ramp rates. The GenTrader model optimized the
22 dispatch of each resource given its generation cost and operating constraints.
- 23 3. Forecast of resource availability: A significant portion of SDG&E's resource
24 portfolio was comprised of must-take resources (QF and renewable energy), as

1 listed in Section II. SDG&E received weekly, and in some cases daily, forecasts
2 of hourly deliveries from the resource operator. In addition, SDG&E generated
3 availability forecasts for some smaller contracts based on historical performance.
4 If the unit availabilities varied from the full operating capability or were on
5 outage, they were communicated to the CAISO via the Outage Management
6 System application (“OMS”).

7 4. Market prices: The GenTrader LCD forecast model required a forecast of fuel
8 prices for each of the dispatchable resources in SDG&E’s portfolio, and a forecast
9 of hourly power prices for various market delivery points where SDG&E
10 generation units were located. Fuel prices were based on forward natural gas
11 price curves at SoCal Border and Kern Delivered (derived from the New York
12 Mercantile Exchange (“NYMEX”), Intercontinental Exchange (“ICE”) and broker
13 quotes) and tariff or contract gas transportation costs. Power prices were based on
14 forward power price curves for block power (derived from ICE and broker
15 quotes) and shaped for each hour using price weighting factors derived from
16 historical prices and load profiles.

17 5. Miscellaneous: Use-limited resources including the Lake Hodges pumped-
18 storage project, NGR resources and demand response products were not modeled
19 by GenTrader due to unique operating constraints and were therefore optimized
20 separately on a day-ahead/weekly basis based on market conditions, LMP price
21 forecasts and operating parameters.

22 GenTrader was then used to calculate the hourly dispatch level of dispatchable resource
23 over the modeled period that was economic, or “in-the-money,” relative to forecasted LMP
24 prices. This determination considered up-front commitment costs (start-up and minimum load

1 costs), incremental dispatch costs which varied by output level, and various operational
2 constraints mostly consistent with resource data template (“RDT”) data used by the CAISO in its
3 market processes. For must-take resources, generation was assumed to equal their forecasted
4 availabilities. If the sum of must-take and in-the-money dispatchable generation was less than
5 that hour’s load requirement, the short position, or Residual Net Short (“RNS”), was considered
6 to be met with market purchases. If the sum of must-take and in-the-money generation was
7 greater than that hour’s load requirement, the long position was considered to be surplus
8 generation available for economic market sales.

9 **B. Day-Ahead Planning**

10 On a day-ahead basis by approximately 6:00 a.m., preschedulers updated the PCI
11 software with updated values, specifically the load forecast, forecasted market prices and
12 resource availabilities. Other resource operational data such as heat rates are relatively static
13 between the 12-day plan and day-ahead plan and were not typically updated. Key distinctions
14 between the 12-day and day-ahead model parameters were as follows:

- 15 1. Load forecast: SDG&E used updated temperature and humidity forecasts
16 from SDG&E’s weather forecasting service to re-run its PRT load
17 forecasting model. In addition, pre-schedulers applied manual
18 adjustments to the PRT result when warranted to offset known limitations
19 to the model. For example, because PRT forecasts were based on
20 historical data, PRT made adjustments to reflect sudden changes to the
21 weather forecast such as the onset of a heat wave. The prescheduler also
22 benchmarked the PRT forecast to that published by the CAISO for
23 SDG&E’s service area (when available) to identify and resolve significant
24 deviations.

- 1 2. Resource availabilities: SDG&E received updated and more accurate
2 availability information for its resources on a day-ahead basis. These
3 updates captured information that may not have been included in the 12-
4 day model, such as ambient derates, forced derates, unit testing and
5 outages. These updates were also submitted to the CAISO via OMS as
6 required.
- 7 3. Market prices: Spot natural gas and power trade actively in the day-ahead
8 market. SDG&E used two different price forecasts as inputs into
9 optimization models. One price forecast is developed internally, early
10 before and during Day-Ahead (“DA”) trading, and the second was
11 provided by an external entity after most of the DA trading subsided. For
12 the first price forecast, SDG&E used an internal forecasting tool using
13 Microsoft Excel to forecast load and resource prices for the DA Market.
14 This DA price forecast was generated by applying historical price spreads
15 and hourly shapes to the SP15 prices traded in the DA market to create a
16 24-hour price forecast. The second forecast was normally received after
17 8:00AM which is normally after most of the DA trading volume is
18 completed. Because of the receipt time, SDG&E’s internally developed
19 price forecast is used for early morning optimization runs, to provide an
20 initial forecast CAISO generation awards. In 2018, SDG&E began
21 receiving nodal DA LMP price forecasts from an outside entity called
22 Genscape, Inc. Genscape, Inc. is an independent, energy industry provider
23 of “market intelligence” which includes nodal DA LMP forecasts and
24 possible transmission congestion risks associated with SDG&E’s

1 generation portfolio of resources. Genscape produces price forecasts
2 daily. Weekend and holiday forecasts are provided the last day before that
3 weekend or holiday period. SDG&E has provided a record of price
4 forecast accuracy with respect to forecasted LMP (SP15 Trading Hub and
5 SDG&E's DLAP) for 2019 and a comparison of forecast accuracy from
6 the previous year in Attachment A - *2019 Summary Load Data and LMP*
7 *price forecasts.xls*). Both editions of forecasted LMPs are entered into
8 PCI to reflect updated market conditions to run the optimization model.

9 After updating the GenTrader model with these inputs, SDG&E then re-optimized the
10 mix of market transactions and resource dispatches. As with the 12-day plan, GenTrader
11 produced a plan for unit commitments, dispatch levels and economic purchases and sales. These
12 results helped inform gas and power trading requirements and analyze the potential for self-
13 scheduling of dispatchable resources.

14 **C. Day-Ahead Trading and Scheduling**

15 The CAISO runs the DAM to economically clear load and resources that were scheduled
16 or bid in. The DAM required SDG&E to submit separate schedules and bids for each resource
17 and load. Results of the DAM became financially binding at the market clearing price for each
18 resource and load that was awarded, and the sum of SDG&E's awarded resources did not
19 necessarily balance with SDG&E's load award. The process to self-schedule and bid in
20 SDG&E's load and resources is discussed below.

- 21 • Load: During the record period, SDG&E sought to self-schedule 100% of
22 the day-ahead bundled load forecast. Self-scheduling ensured that
23 SDG&E would purchase its forecasted load requirement in the DAM
24 rather than rolling the requirement into the real-time market which

1 produces more volatile prices. The DAM was preferred for two other
2 reasons. The first reason was that SDG&E was required to self-schedule
3 or bid in its (non-use limited) resources into the DAM under Resource
4 Adequacy must-offer rules in the CAISO Tariff. Therefore, while
5 balanced schedules were not mandated, the DAM did provide a means for
6 supply revenues to effectively offset the load costs provided that SDG&E
7 self-scheduled its load in the DAM. The second reason was that the depth
8 of the day-ahead bilateral market allowed SDG&E to hedge its self-
9 scheduled load exposed to the CAISO DAM clearing price via market
10 transactions. In the future, SDG&E may choose to bid a portion of its
11 forecasted load. Attachment A - *2019 Summary Load Data and LMP*
12 *Price Forecasts.xlsx* contains detailed summary load data and results.

- 13 • Non-intermittent must-take resources: SDG&E continued to self-schedule
14 available must-take generation on a day-ahead basis to offset DAM load
15 awards. For resources that were scheduled by sellers and not SDG&E,
16 sellers continued to self-schedule their available generation into the DAM.
17 Credit for the DA revenues was transferred back to SDG&E either via an
18 Inter-SC Trade (“IST”) for the self-scheduled quantity or settled after the
19 fact by the settlements group.
- 20 • Generation convergence bids: Some of SDG&E’s intermittent resources
21 that were Variable Energy Resources (“VER”) were scheduled in the
22 hour-ahead scheduling process as required by the CAISO. SDG&E
23 utilized convergence bids to effectively shift the CAISO’s payment for
24 VER resources from the real-time market to the DAM, thereby providing a

1 better offset to load charges which, as discussed above, settle against
2 DAM prices. The Commission authorized this application of
3 Convergence Bidding in D.10-12-034. The daily process consists of three
4 main steps: (1) retrieval of the day-ahead VER forecast for the relevant
5 resources; (2) creation of convergence bid quantities considering (a) the
6 percentage of the day-ahead VER quantity forecast to be shifted into the
7 DAM, (b) convergence bid quantity limitations imposed by the CAISO
8 and (c) reduction of quantities in hours that have historically produced
9 negative returns on the convergence bids SDG&E would have submitted;
10 and (3) pricing of convergence bids such that the virtual supply was not
11 sold at unreasonably low price levels. The results of SDG&E's
12 convergence bidding activity were reported quarterly to the Procurement
13 Review Group ("PRG") as required by D.10-12-034. The remaining VER
14 resources in the portfolio utilized energy bids to also attempt to shift the
15 CAISO's payment for VER resources from the real-time market to the
16 DAM.

- 17 • Dispatchable resources: SDG&E's objective, with respect to self-
18 schedules and price bids for dispatchable resources, was to maintain
19 adherence to LCD principles. This objective was primarily met by
20 bidding generation into the DAM at cost-based prices consistent with the
21 LCD modeling.
- 22 • Generator price bids: Energy bids consist of three basic components -
23 startup cost, minimum load cost and incremental energy bids. Startup and
24 minimum load costs, which can be declared as registered or proxy, were

1 used in the CAISO DAM. In addition, bidding rules required that
2 incremental energy bids be monotonically increasing over the range of
3 output. Other components of the price bid that pertained to A/S-certified
4 units are bids for Regulation, Spinning Reserve and Non-Spinning
5 Reserve. As discussed in Section V below, the DAM algorithm co-
6 optimized dispatchable capacity between generation and A/S awards; and
7 the generator was paid an amount greater than or equal to its opportunity
8 cost of forgoing a profitable day-ahead energy sale. However, co-
9 optimization did not consider lost energy sales in the real-time market.
10 Therefore, SDG&E incorporated an estimate of expected real-time energy
11 market net revenues that the A/S capacity could otherwise derive from that
12 market.

- 13 • Lake Hodges Pumped-Storage Unit: As noted in the LCD modeling
14 discussion, SDG&E performed a separate optimization analysis of Lake
15 Hodges due to its unique operational characteristics. For example, its cost
16 was based on the cost of power required to pump water into the upper
17 reservoir such that the generator could generate power at a later time.
18 Secondly, it was only economic to operate the plant (from an LCD
19 perspective) when the cost of pumping water into the upper reservoir was
20 recovered by revenues from using that water for generation. Given that
21 these unique features presented significant modeling challenges that only
22 applied to 40 MW of generation capacity, SDG&E chose to develop an in-
23 house spreadsheet tool to determine the optimized dispatch of this
24 resource rather than devoting resources to upgrade its GenTrader

1 application. The spreadsheet tool produced a daily bid or self-schedule for
2 the unit for both pump and generation through the following steps: (1)
3 retrieval of an hourly power price forecast over the current week
4 (Monday-Sunday) through Sunday night; (2) determination of
5 economically rational pump and generation hours based on the power
6 price forecast, pump efficiency parameters, variable O&M costs and load
7 uplift charges; and (3) modification of the hours from step 2 based on
8 operational constraints such as water usage restrictions. Trading or
9 scheduling personnel manually reviewed the results, modified as needed to
10 ensure all other operational constraints were respected, and uploaded the
11 final pump and generation self-schedules or bids into SDG&E's
12 scheduling application for submittal into the CAISO market.

13 SDG&E has provided Attachment B, entitled "2019 Hydro and Pump
14 Storage," which includes summary reporting on bidding and dispatch of
15 dispatchable hydro and pumped storage resources. Also, as a guide to the unique
16 constraints and bidding considerations for Lake Hodges, SDG&E is providing a
17 presentation for reference (see Attachment L).

- 18 • Battery Storage: Similar to Lake Hodges, SDG&E performed a separate
19 optimization analysis of Battery Storage due to its unique operational
20 characteristics and opportunity costs associated with potential Ancillary
21 Service revenues and real-time prices. For example, its cost was based on
22 the cost of power required to charge the battery such that the battery can
23 generate power at a later time. Secondly, it was only economic to operate
24 the battery (from an LCD perspective) when the cost of charging the

1 battery was recovered by revenues from discharging the battery. Battery
2 storage is a technology with unique features which presented significant
3 modeling challenges that only applied to 39.5 MW of generation capacity.
4 SDG&E has developed a process to submit bids to optimize the dispatch
5 of this resource. The factors considered in determining bids for battery
6 Storage resources are: (1) Expected DA, RT and A/S prices (2) charge
7 efficiency parameters, (3) variable O&M costs and (3) State of Charge,
8 charge/discharge capacity, and cycling limitations. Trading and
9 scheduling personnel reviewed the bids, to ensure all other operational
10 constraints were respected, and uploaded the final bids for charge and
11 discharge bids into SDG&E's scheduling application for submittal into the
12 CAISO market.

- 13 • Power Trades: During the 2019 record period, SDG&E primarily traded
14 day-ahead financial power to hedge the risk of unknown DAM clearing
15 prices, and their effect on the magnitude of market awards on SDG&E's
16 resources. Financial power was traded in lieu of physical power due to
17 greater market liquidity but provided the same hedge. Like physical
18 power purchases, SDG&E purchased financial power to lock in energy
19 prices below its marginal generation cost or sold financial power to lock in
20 sales of surplus generation above variable cost. The volume of energy
21 purchased or sold was informed by the results of the GenTrader LCD
22 model and a position analysis spreadsheet developed in-house; both tools
23 calculated SDG&E's hourly short or long position based on similar inputs
24 and provided a more robust result of hedging needs than a single model.

1 SDG&E traded these products on the ICE or through voice brokers to
2 ensure competitive prices and submitted these trades for Commission
3 review in its QCR.

4 **D. Hour-Ahead Scheduling and Real-Time Dispatch**

5 The CAISO operated the Real-Time Market (“RTM”) that performed several important
6 functions related to LCD while matching generation and demand to maintain the frequency of
7 the grid. Like the DAM, the RTM established financially binding awards for awarded hour-
8 ahead self-schedules and bids, but only at intertie scheduling points. In addition, the RTM
9 enabled SDG&E to submit updated self-schedules and cost-based bids for its dispatchable
10 resources, so the CAISO could issue incremental or decremental dispatches in the real-time
11 market based on this updated data. SDG&E also self-scheduled its VER resources in RTM as
12 required under VER rules. Of note, the CAISO did not allow load self-schedules and bids to be
13 updated in RTM; any differences between actual load and the load quantity cleared in the DAM
14 were automatically settled at the real-time market price.

15 The CAISO issued incremental and decremental awards an hour before delivery for
16 intertie bids and in real-time (5 to 15 minutes ahead) for online or fast-start internal generation
17 through its Automated Dispatch System (“ADS”). Decremental energy awards essentially
18 caused resources to buy back the day-ahead award if the RTM or real-time price fell below the
19 bid price submitted in RTM; incremental awards caused resources to sell additional energy or
20 A/S relative to the day-ahead award. SDG&E’s resources responded directly to these ADS
21 instructions. If a resource experienced an unplanned outage or other change in operational
22 capability, these updates were submitted to the CAISO via OMS as required to notify the CAISO
23 of the status and preclude infeasible real-time dispatch instructions.

1 Because real-time prices are historically more volatile than, and can deviate significantly
2 from, the day-ahead price, the impact of the real-time market on SDG&E's LCD results varied
3 day-to-day. This impact could be particularly negative if real-time market prices spiked when
4 SDG&E's portfolio was significantly short. The short position could arise for several reasons,
5 including:

- 6 • SDG&E generally self-scheduled 100% of its forecasted load in the DAM;
7 if actual load exceeded the forecast, the result was a short real-time
8 position;
- 9 • Resources (must-take and dispatchable) that were awarded in the DAM
10 carried a delivery obligation in the real-time market for the awarded
11 quantity; thus, an outage or curtailment to any of these resources that
12 prevented it from meeting its day-ahead obligation resulted in a short real-
13 time position;
- 14 • Awarded convergence bids in the DAM triggered a buyback in the real-
15 time market; if this buyback was not fully covered by physical generation,
16 the convergence bid resulted in a short real-time position; and
- 17 • If real-time prices were lower than day-ahead, the CAISO could dispatch
18 resources below their day-ahead award, as described earlier in this section;
19 these decremental dispatches would result in a short real-time position
20 (albeit a desirable one should real-time prices continue to remain low).

21 If real-time prices spiked under any one or more of these scenarios, SDG&E's
22 dispatchable resources may not have been able to ramp quickly enough to fully eliminate the
23 short position. The combination of real-time price spikes and short portfolio position was and
24 continues to be a constant risk to ratepayers, depending on the severity of each.

1 **E. Award Retrieval and Validation**

2 SDG&E retrieved CAISO day-ahead awards and communicated them to its resources.

3 While dispatchable generators in fact respond to CAISO ADS or regulation dispatch in real-time,
4 they required timely notice of day-ahead awards in order to adequately prepare to meet startup,
5 shutdown and MSG transition requirements. Furthermore, advance notification of regulation
6 awards ensured that generators would be prepared to operate in Automated Generation Control
7 (“AGC”) in order to follow regulation dispatch. Lastly, the day-ahead notification allowed
8 enough time to address any inconsistencies between a generator’s day-ahead award and its stated
9 operational constraints previously communicated to the CAISO through OMS.

10 SDG&E performed a post-market assessment to review market results and validate that
11 the CAISO process resulted in LCD of SDG&E’s portfolio. The assessment is referred to as the
12 Bid Evaluator report, provided through the PCI software package. Bid Evaluator compared
13 SDG&E’s expected day-ahead awards for its dispatchable generation based on published market
14 prices with actual DAM results. Generally, the market results aligned closely with Bid Evaluator
15 results (subject to operational constraints), confirming that LCD of SDG&E’s portfolio was
16 achieved.

17 Although SDG&E investigated substantive deviations between CAISO market solutions
18 and Bid Evaluator optimization, any deviations did not necessarily indicate an incorrect dispatch
19 or need for further action. Upon citing a deviation, SDG&E could modify inputs or bidding
20 strategy, initiate a change proposal to PCI for development, or notify CAISO of deviations to
21 determine the cause which may be recognized as a market flaw through Customer Inquiry
22 Dispute and Information (“CIDI”) tickets.

1 **VI. CONSTRAINTS TO LEAST-COST DISPATCH**

2 As stated in the discussion of LCD principles, SDG&E performed its LCD activities
3 within limits established by numerous types of constraints that range from operational,
4 regulatory and contractual to risk mitigation and market conditions. An after-the-fact review of a
5 particular day’s dispatch may show a deviation from LCD because of the effects of such
6 constraints.

7 Some constraints were operating limits inherent to the resources in the portfolio. For
8 example, generators cannot continually cycle back and forth between online and offline because
9 of minimum run time and shutdown time of each combustion turbine. Therefore, the lowest cost
10 unit may not have been dispatched if adequate time for startup was not available. Some other
11 common examples of LCD constraints include, but are not limited to, the following:

- 12 • Exceptional Dispatch (“ED”) is a form of dispatch the CAISO relies on to
13 meet reliability requirements that cannot be resolved through market
14 processes. The CAISO orders EDs to address local generation
15 requirements, system capacity needs, transmission outages, software
16 limitations and other operational issues. Because EDs are reliability-
17 driven, they are outside the scope of LCD and likely to be uneconomic
18 relative to market prices or other resources. All CAISO resources are
19 obligated to comply with these dispatches.
- 20 • Residual Unit Commitment (“RUC”) is a market award for capacity,
21 which the CAISO issues to ensure that sufficient capacity is committed to
22 meet system load. Although RUC resulted from the market process, it is
23 required to manage grid reliability and is outside the scope of LCD.
24 SDG&E resources were obligated to be available to provide the RUC

1 capacity if awarded, which required that they could be committed
2 uneconomically relative to other resources.

- 3 • Unit testing and maintenance, such as Relative Accuracy Test Audit
4 (“RATA”) tests and heat treats, require generators to run at pre-defined
5 load points to achieve an objective. During these periods, generation is
6 considered must-take and cannot be dispatched according to LCD
7 economics.
- 8 • Constrained pipeline operations may impact LCD. A generator may be
9 constrained in its ability to provide real-time dispatch because of limited
10 gas balancing rights on a pipeline. Another example of pipeline
11 constraints was Operational Flow Orders (“OFOs”) declared by Southern
12 California Gas Company (“SoCalGas”). Under a high-inventory OFO, if a
13 resource failed to consume 90% of the scheduled natural gas quantity, the
14 pipeline assessed penalties. Therefore, resources were constrained from
15 following real-time LCD economics to decrease generation.
- 16 • Use-limited resources are resources that are only available for a limited
17 number of hours or starts per period. For example, annual environmental
18 restrictions limit the number of startups on certain combustion turbines.
19 Other resources that were use-limited include Demand Response programs
20 that can be triggered for limited hours each month.
- 21 • CAISO market solutions look at 24-hour time horizons and to come up
22 with the most economic “system” solution, individual resources may need
23 to be awarded uneconomically or may not be awarded even though a
24 specific resource may appear to be economical with respect to its clearing

1 prices to satisfy specific reliability requirements. Therefore, LCD is
2 achieved on a system basis while satisfying unique transmission and
3 reliability constraints as opposed to evaluating an individual unit on an
4 hour by hour basis.

5 **VII. SUMMARY REPORTS AND TABLES**

6 In this Section, SDG&E provides additional detailed information that support SDG&E's
7 execution of the LCD process during 2019, as described in Section IV. The following provides a
8 description of information provided as well as tables which summarize annual exceptions for
9 incremental cost bid calculations, self-commitment decisions and Master File data changes:

- 10 1. Incremental Cost Bid - Incremental bids submitted to the CAISO are calculated
11 using the heat rate, fuel costs, fuel transportation fees, GHG costs, and variable
12 operations and maintenance costs and any other costs used in the calculation. For
13 the record period, the annual and monthly tables below provide a listing of all
14 variances between calculated and submitted bids that are greater than \$0.10 and
15 the related cost impacts. In addition, the table provides any occurrences where
16 dispatchable resources were not bid into the CAISO markets when available.
17 *Attachment C – 2019 Incremental Bid Cost Calculations.xlsx* provides details of
18 incremental bids submitted to the CAISO and any potential exceptions. Potential
19 reasons for LMP clearing higher than incremental bid costs include but are not
20 limited to the consideration of start-up and minimum load costs, MIP (“Mixed
21 Integer Processing”) gap, inter-temporal constraints, transmission constraints,
22 conditions used as initial conditions for next day and the effect of adjacent
23 balancing authorities’ areas.

Table 2			
Summary of 2019 Incremental Bid Cost Exceptions			
Month	No. of Variances (2B)	% of Bids Submitted	Cost Impact \$ (2C)
January	0	0.00%	\$0.00
February	0	0.00%	\$0.00
March	0	0.00%	\$0.00
April	0	0.00%	\$0.00
May	0	0.00%	\$0.00
June	0	0.00%	\$0.00
July	0	0.00%	\$0.00
August	0	0.00%	\$0.00
September	0	0.00%	\$0.00
October	0	0.00%	\$0.00
November	72	0.40%	
December	0	0.00%	\$0.00
Total	72	0.04%	

In November of 2019, SDG&E had two bid exception incidents when submitting bids for Palomar Energy Center (PEC), a multi-stage generation (“MSG”) unit, which were related to a software update to SDG&E’s scheduling system (Power Costs Inc (“PCI”).

The first incident occurred while scheduling energy for November 9th, when as a result of the software update, PCI did not populate the bid template for the 2x1 generation configuration. SDG&E discovered the issue later the same day while reviewing bids to be submitted for the following day. PCI was alerted to the problem and they were able to fix it prior to submitting schedules for November 10th. SDG&E had a quality control process in place to verify the bids for each resource. The quality control process did not detect the error in this instance because, while SDG&E’s process verified that bids were populated for each resource, it did not verify that bids for each configuration of all of its resources had been populated. SDG&E immediately updated its quality control process to verify the bids for each configuration of all of its resources had been correctly populated.

1 The second bid exception incident occurred when scheduling for November 12th. The
2 bids for PEC 2x1 generation stage were correctly created, populated, verified and submitted to
3 the CAISO. However, just prior to the 10:00 am CAISO bid submittal deadline, a background
4 process ran in PCI, which unbeknownst to SDG&E, re-submitted SDG&E's bids. The PEC 2x1
5 bids originally submitted were inadvertently over-written by new bids created by PCI that did not
6 populate the PEC 2x1 configuration. SDG&E has asked PCI to complete a root cause analysis to
7 determine what triggered this process to run and what could be done to ensure it will not occur
8 again. For the remainder of the record year, SDG&E monitored PCI to make sure the process
9 did not run again.

10 PEC was claimed for Resource Adequacy (RA) in November, and when bids are not
11 submitted for RA resources, the CAISO creates default bids. The default bids for PEC were
12 slightly higher than the bids SDG&E had intended to submit for both incidents. These higher
13 default bids may have caused PEC not to receive generation schedules in the 2x1 configuration.
14 SDG&E's analysis shows it would have received greater revenues than costs for both incidents
15 had it received a generation schedule. The potential impact can be found in Table 2.

16 In both incidents, the CAISO may have not awarded generation schedules for PEC 2x1 as
17 the result of a CAISO commitment decision. SDG&E's analysis shows that even when
18 compared to the slightly higher default bids, PEC 2x1 would have been economic to run, and
19 should have received a generation schedule. Therefore, the higher default bids may not have
20 impacted the CAISO dispatch.

- 21 1. Self-Commitment – The summary tables 3-a and 3-b below contain the costs of
22 self-schedule decisions for dispatchable thermal resources during the record
23 period. Also contained are details including total energy self-scheduled and
24 supporting data of daily forecasts of schedules if bid or self-scheduled, forecast

1 revenues and bid costs if bid or self-scheduled, and decisions to self-schedule or
 2 bid. Attachment D - 2019 Self Schedules Supporting Data 1.xlsx and Attachment
 3 E - 2019 Self Schedules Supporting Data 2.xlsx contain the details of self-
 4 commitment costs and the reasons to self-schedule. Table 3-a and 3-b below
 5 summarize cost impacts of self-scheduling.

- 8 2. Master File Data Changes –SDG&E can change Master File submissions to
 9 reflect Proxy or Registered Start-Up or Minimum Load costs for its dispatchable
 10 resources depending on market conditions. In 2019, SDG&E solely submitted
 11 Proxy Start-Up costs for its dispatchable resources. Table 4, the annual table

1 below, summarizes the number of times and the reasons for selecting proxy or
2 registered costs. In addition, the tables provide the frequency of calculations that
3 differed from values submitted to the CAISO, and the cost impacts, by month.
4 Attachment F – 2019 Master File (RDT) Change Exceptions.xlsx provides the
5 details of changes made during the record period. Table 4 below summarizes
6 proxy and registered cost change exceptions.

8 **VIII. MARKET DESIGN AND PROCESS CHANGES**

9 The following is a summary of certain CAISO market design changes that have affected
10 SDG&E’s business processes during 2019:

- 11 1. Energy Storage and Distributed Energy Resources (“ESDER”) Phase 3A aims to
12 identify and mitigate barriers that hinder effective market participation of storage
13 and distributed energy resources. The presence of renewables and storage
14 continues to increase and evolve, and therefore so does the integration of these
15 resources into the CAISO markets. The multi-phase ESDER initiative allows
16 these resources to participate more efficiently, thus allowing for more robust
17 market solutions while reducing carbon emissions.
- 18 2. Commitment Costs & Default Energy Bid Enhancements 1 (“CCDEBE”) aims to
19 improve integration of renewable resources through incentivizing flexible
20 resources participation during tight fuel supply and account for costs of flexible
21 resources (gas and non-gas) to reduce risk of insufficient cost recovery. These

measures also included changes to CAISO's rules for Local Market Power Mitigation. Finally, the CAISO made tariff changes to comply with FERC Order 831 which increased the maximum energy bid cap of \$2,000/MWh with required cost verification of bids above \$1,000/MWh for internal CAISO BAA and resource specific system resources only.

IX. ANNUAL TABLE

The following table summarizes, by resource type, the total capacity bid or self-scheduled into the market as well as capacity lost due to planned or forced outages. The table also includes total energy awards for each resource broken down by self-schedules versus market awards. Attachment G - 2019 Annual Summary.xlsx provides the details of dispatchable and non-dispatchable resources. Table 5 is an annual summary of dispatchable and non-dispatchable resources including capacity available and unavailable, self-schedules and DAM awards.

Table 5 Background Summary- 2019 Annual Summary						
Dispatchable	Resource Type	Capacity (PMAx in MWh)	Unavailable Capacity (MWh)	DA SS Awards (MWh)	Award due to Market	Total Awards
Non-Dispatchable	Resource Type	Capacity (PMAx in MWh)	Unavailable Capacity	DA SS Awards (MWh)	Award due to Market	Total Awards

X. FUEL PROCUREMENT

During the record period, SDG&E supplied fuel for gas-fired, dispatchable resources in the portfolio. SDG&E performed as the pipeline-registered Fuel Manager and Fuel Supplier for most of its dispatchable resources. These included SDG&E-owned or -contracted resources (Miramar, Cuyamaca, Palomar, Desert Star, OMEC (January-October 2, 2019), Orange Grove,

1 El Cajon Energy Center and Goal Line). The fuel costs for these SDG&E resources are charged
2 to SDG&E's Energy Resource Recovery Account ("ERRA") balancing account with the
3 exception of Goal Line which is charged to SDG&E's Transition Cost Balancing Account
4 ("TCBA"). The fuel costs for Pio Pico Energy Center, Carlsbad Energy Center, and Escondido
5 Energy Center are charged to the Local Generating Balancing Account ("LGBA").

6 As discussed in the Commission-approved BPP, SDG&E's procurement process is to
7 secure approximately 90% of forecasted fuel volumes required to serve SDG&E's load forecast
8 (but not economic sales) as firm monthly baseload supply. The advantages of baseload supply
9 are that: (1) it shields ratepayers from potentially volatile day-ahead natural gas prices; (2) it's
10 scheduled by market participants as a higher priority delivery than day-ahead supply; and (3) it
11 reduces the day-to-day trading and scheduling requirements, thereby reducing overall operational
12 requirements. While the cost of baseload supply may be lower or higher than the spot price on
13 any given day, over time, these price differentials average toward zero, leaving SDG&E with the
14 benefits cited above.

15 While most fuel supply was procured as firm monthly baseload, during the Record Year,
16 SDG&E used prevailing day-ahead or intra-day market prices to price out day-ahead or intra-day
17 generation costs, which is consistent with LCD. For example, if the portfolio was short fuel,
18 relative to day-ahead requirements, fuels traders purchased incremental supply at the DAM price.
19 Or, if the portfolio was long on fuel relative to real-time requirements, fuels traders sold the
20 surplus baseload supply at the same-day market price. This coordination between fuel and
21 power trading enabled SDG&E to accurately price variable generation costs so that the benefits
22 of market transactions could be properly evaluated. Both baseload and daily natural gas trades
23 for the record period were executed at competitive prevailing market prices and in compliance

1 with the BPP. All SDG&E natural gas transactions for 2019 were reported and are reviewed by
2 the Commission in SDG&E's QCR under the advice letters cited in Section I, above.

3 SDG&E also entered into financial transactions to hedge fuel costs during the record
4 period. Hedge transactions consisted primarily of futures and basis swap purchases which
5 together fixed the forward price of the monthly Natural Gas Intelligence ("NGI") SoCal Border
6 index or the NGI SoCal CityGate index. Futures trades were executed through New York
7 Mercantile Exchange and Intercontinental Exchange. Basis swaps were executed over-the-
8 counter ("OTC") directly with counterparties or through voice brokers and typically cleared
9 through ICE Clear, a widely-used clearinghouse for OTC trades. These hedge transactions
10 complied with the BPP and internal quarterly hedge plans and were submitted for Commission
11 review in SDG&E's QCR. However, hedge transactions are not considered in evaluating
12 variable operating costs in the day-ahead or real-time markets and therefore do not affect the
13 LCD process.

14 During the record period, SDG&E held Backbone Transportation Service ("BTS") to
15 transport natural gas from the various SoCal Border trading points to the SoCal Citygate.
16 SDG&E purchased the BTS capacity from SoCalGas pipeline to increase the priority of fuel
17 delivery to its dispatchable resources. The decision to purchase BTS is determined by several
18 factors including: the price spread between the SoCal Border point and the SoCal Citygate, the
19 quantity of BTS offered by SoCal Gas, and the amount of Firm Interstate capacity SDG&E has
20 purchased that can feed into specific SoCal BTS points. Firm Interstate capacity represent fixed
21 costs and therefore are not considered in the LCD process.

22 The CAISO's DAM process creates uncertainty of gas quantities to be traded in the
23 DAM. Day-ahead generation awards are not known until approximately 1:00 p.m., well after
24 next-day natural gas finished trading. Because of the time lag, fuels traders need to rely on

1 generation award forecasts and judgment to establish their next-day fuel position. When actual
2 results deviated from forecasted fuel quantities, fuels traders primarily relied on gas balancing
3 services offered on SoCalGas' system and, the Kern and Southwest Gas pipelines. SDG&E also
4 traded and/or scheduled gas supplies in later pipeline scheduling cycles to avoid potential
5 imbalance penalties. Activity in these later scheduling cycles was avoided to the extent lower
6 availability of competitive bids and offers caused incremental transactions to cost more to
7 SDG&E.

8 **XI. DEMAND RESPONSE (“DR”)**

9 SDG&E has developed and offered a variety of DR programs to its customers since 2001.
10 The scope of these programs has changed as the concept of DR has evolved and has become an
11 integral part of resource planning and energy management. DR programs have design objectives
12 (reliability, economic, emergency, etc.) as well as specific tariffs or guidelines which describe set
13 trigger conditions such as heat rate, system load, temperature forecast and/or emergency
14 conditions. When triggers are met, SDG&E has discretion to dispatch a program, which allows
15 SDG&E to assure event hours are available for times of greater need and optimize the value of
16 the programs.

17 During the record period, SDG&E utilized its DR programs primarily to reduce
18 electricity consumption during peak demand or to respond to system reliability needs. SDG&E's
19 portfolio consists of programs that have economic triggers as well as programs with all non-
20 economic triggers. Pursuant to D.15-05-005, as discussed above,¹¹ SDG&E's Capacity Bidding
21 Program (“CBP”) and Summer Saver Program (“SSP”)¹² demand response programs, are subject
22 to the LCD standard as they have economic triggers and have been bid into the CAISO market

¹¹ See pp. JP-2 – JP-3 above.

¹² D.16.-06-029 in conjunction with AL 3050-E-A and AL 3050-E-B approved on July 21, 2017 and effective January 1, 2017.

1 during 2019. SDG&E has a Reliability Demand Response Resource (“RDRR”) that is also bid
2 into the CAISO. The Base Interruptible Program (“BIP”) will be dispatched by the CAISO only
3 if there is a stage one emergency and prices are at least \$950 Per MWh. BIP was not dispatched
4 by the CAISO in 2019 and was triggered only once on September 4, 2019 for testing. In the
5 remainder of this section, SDG&E provides information pertaining to both the CBP and SSP
6 programs in SDG&E’s DR portfolio and explains how the programs were utilized in 2019.

7 **A. Capacity Bidding Program (“CBP”)**

8 CBP is an optional Demand Response program available to all commercial and industrial
9 customers in the SDG&E’s territory. CBP is operational from May 1st to October 31st each year.
10 Program operation hours are Monday through Friday, excluding holidays, from 11 A.M. to 7
11 P.M. or from 1 P.M. to 9 P.M. Participants receive a monthly capacity payment in exchange for
12 reducing their load when requested by the utility. Participating customers who are also receiving
13 bundled services from SDG&E receive an additional energy payment during CBP events.

14 CBP participating customers can choose to participate in one of two CBP products: (1)
15 CBP Day-Ahead, and (2) CBP Day-Of. The distinction between the product types is the pre-
16 event notification timing. Under the Day-Ahead Product, customers are notified by no later than
17 3 P.M. the day prior to the actual event. The Day-Of Product, provides event notification two
18 hours prior to the start of the event. SDG&E bids all products in the day-ahead CAISO market
19 because the CAISO has limitations on dispatching in real time. The CAISO is addressing the
20 issue and planning to implement a solution for 2021. SDG&E can dispatch in real-time based on
21 the two-hour notification mentioned above.

22 CBP is capped at 24 events in May through October. The program triggers are:

- 23 • SDG&E may call an event when SDG&E’s DLAP or when applicable, an
24 established PNode price, reaches a price of \$80 in the Day-Ahead product.

1 The Day-Of product trigger is a price of \$95 for the 11am-7pm product
2 and \$110 for the 1pm-9am product.

- 3 • SDG&E may call an event if SDG&E system conditions warrant; or
- 4 • At the request of CAISO (though still SDG&E’s discretion to deploy).

5 Although the CBP tariff outlines program triggers, SDG&E is not required to dispatch the
6 CBP program every time the economic trigger is reached. Therefore, SDG&E takes forecasted
7 system demand, program limitations, and customer fatigue into account before making a final
8 decision about dispatching the program.

9 SDG&E incorporates a bid strategy to select the maximum of the highest price (for at
10 least two consecutive hours and up to four) occurrences in a particular month. Each day,
11 SDG&E forecasted the applicable PNode’s LMP for every remaining program operation hour
12 (between 11am and 7pm or 1pm and 9pm) of the month. With this forecast, the National Gas
13 Intelligence (“NGI”) monthly index of the SoCal Citygate gas price or the balance of the month
14 price was applied to produce an hourly heat rate forecast. SDG&E then calculated the twelfth
15 highest consecutive two-hour price average for the balance of operation hours of each month. If
16 the twelfth highest forecasted price was above a \$80,¹³ SDG&E used that value to formulate a
17 bid price. If the twelfth price was below \$80, SDG&E used a fixed price of \$80 as a bid price.
18 After the CBP was dispatched the first time, SDG&E then would take the eleventh highest price
19 of the remaining days of the month and so on until the twelfth dispatch. Bid prices may vary
20 daily depending on revised, daily price forecast and/or the number of times CPB was dispatched.

21 The CBP was activated on forty-four- (44) occasions during the 2019 event season.
22 Twenty-One (21) events were day-ahead and twenty-three (23) were day-of events. In all cases

¹³ The Day-Of Product trigger is a price of \$95 for the 11-7 product and \$110 for the 1-9 product.

1 when CBP events were initiated during the 2019 record period, the quantified economic triggers
2 from the tariff were met, and SDG&E determined that the system needs warranted such actions.
3 CBP DA was available for all months except for June 2019 were only the CBP DA 1-9 product
4 was available. The reason that the CBP DA 11-7 was not available during this month is due to
5 the fact that SDG&E did not have enough nomination from aggregators for that product.

6 SDG&E started market integration for CBP in October of 2014 and continued to do so
7 for the 2019 season. CBP includes bundled customers and customers being billed on Utility
8 schedule. CBP is also available to Direct Access and Community Choice Aggregation. SDG&E
9 plans to continue bidding the CBP portfolio into the CAISO markets in 2020.

10 **B. Summer Saver Program**

11 The Summer Saver Program (“SSP”) is a voluntary Air Conditioner (“AC”) Cycling
12 program that utilizes one-way Direct Load Control switches to obtain predictable load reduction.
13 The air conditioner unit is cycled off based on customer’s elected cycling option. Residential
14 100% or 50%, Commercial 30% or 50%. SSP is available to all residential customers and
15 commercial customers with energy demands less than 100kW with central air conditioning in
16 SDG&E’s territory. The SSP is operational from April 1st to October 31st each year. Program
17 operation hours are Monday through Sunday, excluding holidays, from 12 P.M. to 9 P.M.
18 Events may range from two to four hours with a 20 event or 80-hour annual maximum.
19 Participants receive an SDG&E annual bill credit in December for enrollment in the program.

20 The SSP trigger is 35,000 Btu/kWh heat rate for April through May and October, 25,000
21 Btu/kWh heat rate for July through September and available for imminent statewide or local
22 emergencies.

23 SDG&E incorporates a bid strategy to select the 40th highest heat rate (for two
24 consecutive hours) occurrences in a season. Each day, SDG&E forecasted the applicable

1 PNode's LMP for every remaining program operation hour (between 12pm and 9pm) of the
2 season. With this forecast, the National Gas Intelligence monthly index of the SoCal Citygate
3 gas price or the balance of the month price was applied to produce an hourly heat rate forecast.
4 SDG&E then calculated the 40th highest market heat rate (for a consecutive two-hour period) for
5 the balance of operation hours of the year. If the highest forecasted heat rate was above the
6 trigger, SDG&E used that value to formulate a bid price. If the highest forecasted heat rate was
7 below the trigger, SDG&E used the heat rate associated with the month to formulate a bid
8 price. The bid price was calculated by taking the higher of the trigger heat rate and the highest
9 forecasted heat rate and multiplying that value times the SoCal Citygate¹⁴ price for the next day.
10 After the SSP is dispatched the first time, SDG&E then would take the 39th highest forecasted
11 heat rate of the remaining days of the month and so on until the 40th dispatch. Bid prices may
12 vary daily depending on revised, daily forecasted heat rates and/or the number of times PDR was
13 dispatched.

14 SSP was activated on twenty-seven (27) occasions during the 2019 event season. In all
15 cases when SSP events were initiated during the record year of 2019, the quantified economic
16 triggers from the tariff were met, and SDG&E determined that the system needs warranted such
17 actions. Demand Response Metrics

18 In D.14-05-025, the Commission approved various reporting requirements proposed by
19 Cal PA. The following discussion outlines those requirements as well as the manner in which
20 SDG&E responded to them for Record Year 2019.

- 21 1. An annual summary of the results of the reporting requirement (related to dispatch
22 of DR resources) adopted in D.14-05-025. At a minimum, the utilities should
23 provide a summary of:

¹⁴ SDG&E switched from ICE SoCal Citygate to CAISO published gas price on August 18, 2017.

- a. The times and duration that all programs were dispatched;
 - b. All cases where the DR program's trigger conditions were forecast to be met, and all cases where these trigger conditions were met;
 - c. A list of occurrences when DR resources should have been dispatched but were not (*i.e.*, a DR resource's economic trigger conditions were forecast by the utility, but it was not dispatched). Each occurrence should be accompanied by an explanation detailing the reason for non-dispatch.
2. In addition to the Reporting Requirement in D.14-05-025, a calculation should be provided of the number of hours when the utility forecasts that trigger criteria will be reached, as a percentage of hours in which trigger conditions were reached in the same time period (monthly and annual basis).
 3. The total energy dispatched as a proportion of maximum available energy for each DR program under scope of the proceeding (monthly and annual breakdowns). This comparison should be provided in both percentage and nominal (MWh) terms. An example of the format is provided below:
 - a. In 2019 record year, utility A's CBP program dispatched 100MWh. This is compared to a total maximum available dispatch of 200 MWh for that program.
 - b. Therefore, utility A's CBP program did not dispatch 100 MWh of its total maximum available energy.
 - c. In 2019 record year, utility A dispatched 50% of the available energy in the CBP program.
 4. For each event the full capacity was not dispatched, an explanation should be provided as to why the DR resource was not dispatched to its maximum

1 availability during the record period.

2 5. If the metrics in (3.) above show that available energy was not dispatched for a
3 program, provide an estimate of the net cost impact on overall resource
4 dispatch of not utilizing maximum available amounts when the program triggers
5 have been forecasted to be reached. This metric should focus on the net cost of
6 dispatching metric (3)(b).

7 6. Metrics should be provided by the utility to identify whether the selection of DR
8 events called minimized the utility's overall portfolio costs of dispatching
9 supply resources. This assessment should include the average hourly net cost
10 impact by program.

11 a. For events dispatched in the record year.

12 b. For all time periods when DR program triggers were forecasted by the
13 utility (whether dispatched or not).

14 c. Comparison of a) and b) in both percentages and nominal (MWh) terms.

15 7. An explanation of how opportunity cost analyses were used to make the decision
16 to call or not call an event. This should include an explanation of the
17 opportunity cost methodology and demonstration of its application.

18 SDG&E has reviewed the preceding requirements, and in the following, discusses how
19 the metrics SDG&E supplied in the accompanying attachments to this testimony for record
20 period 2019 comply with these requirements.

21 1. Attachment H - *2019 ERRR Demand Response Metric 1.xlsx* provides CBP
22 summary results of when program was dispatched, when trigger conditions were
23 forecasted and/or met, a list of occurrences when CBP was not dispatched but hit
24 triggers, as well as the reason for non-dispatch.

- 1 2. In the 2019 record period, SDG&E used the DAM clearing prices as the forecast
2 trigger criteria for CBP Day-Ahead because the deadline to call the event is after
3 the Day-Ahead final schedules are published. With respect to CBP Day-Of,
4 SDG&E used the published DAM clearing prices and other real-time market
5 conditions to determine if the CBP Day-Of should have been dispatched but did
6 not forecast price triggers. As a result, the hours when the utility forecasts the
7 trigger will be the same as the number of hours when the trigger conditions were
8 met and no further data was provided.
- 9 3. *Attachment I - 2019 ERRA Demand Response Metric 2.xlsx* provides CBP
10 summary results of total energy dispatched as a proportion of the maximum
11 available energy for CBP Day-Ahead and Day-Of. The comparison provides the
12 metric in percentage and nominal (MWh) terms.
- 13 4. *Attachment H - 2019 ERRA Demand Response Metric 1.xlsx* provides an
14 explanation when CBP was not dispatched but hit triggers. CBP Day-Ahead
15 Product and Day-Of was dispatched to full capacity each time SDG&E triggered
16 an event.
- 17 5. *Attachment J - 2019 ERRA Demand Response Metric 5.xlsx* provides a net cost
18 impact of CBP Day-Ahead and Day-Of when triggers were met and resource
19 was not dispatched to its maximum available capacity.
- 20 6. *Attachment K - 2019 ERRA Demand Response Metric 6* provides the average
21 hourly net cost CBP events called in the 2019 record period compared to the
22 average hourly potential next cost from all times when trigger conditions were
23 forecast (Dispatched or Not).
- 24 7. As described above in Section X, SDG&E utilized its DR programs during the

1 record period primarily to reduce electricity consumption during peak demand or
2 in response to system reliability needs. The instances in which SDG&E did not
3 call events when triggers were met, were based on a combination of current
4 system needs, and the benefit of reserving the resource to provide for a greater
5 system need.

6 **XII. CONCLUSION**

7 My prepared direct testimony describes SDG&E's plans and processes used during the
8 record period for serving load from its fully integrated portfolio of utility-owned resources,
9 power purchase contracts and market transactions, consistent with the Commission-approved
10 BPP in effect. SDG&E consistently complied with applicable Commission's decisions
11 addressing LCD requirements for the 2019 record period. In summary, SDG&E's LCD
12 processes are fully consistent with and satisfied the Commission's requirements by considering
13 variable costs and utilizing the lowest-cost resource mix, subject to constraints in the day-ahead,
14 hour-ahead and real-time markets. Therefore, SDG&E requests that the Commission find that
15 SDG&E demonstrated compliance with the Commission's LCD and SOC 4 standards during the
16 2019 record period.

17 This concludes my prepared direct testimony.

1 **XIII. QUALIFICATIONS**

2 My name is Joseph Pasquito. My business address is 8315 Century Park Court,
3 San Diego, California 92123. I am currently employed by SDG&E as a Market Analysis
4 Manager. My responsibilities include the technical analysis of SDG&E's bundled load portfolio
5 of supply assets for the benefit of retail electric customers. I assumed my current position in
6 August 2014.

7 Previously, I was a senior electricity trader for SDG&E, primarily managing day-ahead
8 and forward procurement of Electricity and Natural Gas. Prior to joining SDG&E in 2003, my
9 experience included four years as an energy trader.

10 I hold a bachelor's degree in Economics from the United States Naval Academy and a
11 Masters of Business Administration with an emphasis in Finance from Georgia State University.

12 I have previously testified before the Commission.

DECLARATION
OF JOSEPH PASQUITO

A.20-06-XXX

Application of San Diego Gas & Electric Company (U 902-E) for Approval of: (i) Contract Administration, Least Cost Dispatch and Power Procurement Activities in 2019, (ii) Costs Related to those Activities Recorded to the Energy Resource Recovery Account and Transition Cost Balancing Account in 2019 and (iii) Costs Recorded in Related Regulatory Accounts in 2019

I, Joseph Pasquito, do declare as follows:

1. I am the Market Analysis Manager for San Diego Gas & Electric Company ("SDG&E"). I have included my Direct Testimony ("Testimony") in support of SDG&E's Application for Approval of: (i) Contract Administration, Least Cost Dispatch and Power Procurement Activities, and (ii) Costs Related to those Activities Recorded to the Energy Resource Recovery Account, incurred during the Record Period January 1, 2019 through December 31, 2019, and (iii) the Entries Recorded in Related Regulatory Accounts. Additionally, as Market Analysis Manager, I am thoroughly familiar with the facts and representations in this declaration and if called upon to testify I could and would testify to the following based upon personal knowledge.

2. I am providing this Declaration to demonstrate that the confidential information ("Protected Information") in support of the referenced Application falls within the scope of data provided confidential treatment in the IOU Matrix ("Matrix") attached to the Commission's Decision D.06-06-066 (the Phase I Confidentiality decision). Pursuant to the procedures adopted in D.08-04-023, I am addressing each of the following five features of Ordering Paragraph 2 in D.06-06-066:

- that the material constitutes a particular type of data listed in the Matrix;
- the category or categories in the Matrix the data correspond to;
- that SDG&E is complying with the limitations on confidentiality specified in the Matrix for that type of data;
- that the information is not already public; and
- that the data cannot be aggregated, redacted, summarized, masked or otherwise protected in a way that allows partial disclosure.

3. The Protected Information contained in my Testimony constitutes material, market sensitive, electric procurement-related information that is within the scope of Section 454.5(g) of the Public Utilities Code.] As such, the Protected Information provided by SDG&E is allowed confidential treatment in accordance with Appendix 1 - IOU Matrix in D.06-06-066.

Confidential Information	Matrix Reference	Reason for Confidentiality
Table 2- Column Cost Impact	XI	Monthly Procurement Costs (Energy Resource Recovery Account), Confidential for three years
Table 3-a Table 3-b	XI	Monthly Procurement Costs

Attachment C	II.B XI	Utility Retained Generation (URG) Confidential for three years Monthly Procurement Costs

Attachment D, E	XI	Monthly Procurement Costs
Attachment F	IX.B	Recorded data on specific resources (rather than broad categories of supply sources) used to serve bundled load; Appendix I IOU Matrix does not specify effective period of confidentiality.
	IV.A	Forecast of IOU Generation Resources
Attachment G	XI	Monthly Procurement Costs
	VI.B	Utility Bundled Net Open Position for Energy (for MWh)
Attachment L	XI	Monthly Procurement Costs
Attachment M	XI	Monthly Procurement Costs

4. I am not aware of any instances where the Protected Information has been disclosed to the public. To my knowledge, no party, including SDG&E, has publicly revealed any of the Protected Information.

5. I will comply with the limitations on confidentiality specified in the Matrix for the Protected Information.

6. The Protected Information cannot be provided in a form that is aggregated, partially redacted, or summarized, masked or otherwise protected in a manner that would allow further disclosure of the data while still protecting confidential information.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed this 29th day of May, 2020, at San Diego, California.
