

Company: San Diego Gas & Electric Company (U 902 M)
Proceeding: 2024 General Rate Case
Application: A.22-05-____
Exhibit No: (SDGE-36-WP)

WORKPAPERS TO
PREPARED DIRECT TESTIMONY
OF DANE A. WATSON
ON BEHALF OF SAN DIEGO GAS & ELECTRIC COMPANY
VOLUME 1 of 12
BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF CALIFORNIA

MAY 2022

Interview Notes

SDGE Electric Interviews
7-26-2021 –Electric Distribution

363 – Battery Storage will be covered in later interview

364 – Poles

Current materials are wood steel and concrete. Steel poles have a 50+ years life per the manufacturer which is also support by operations experience., Wood poles changing to steel - 30 or so years. Concrete 20-30 years - issues with spalling corrosion. Fiberglass 30+ years. 47-year life currently. There are still a lot of wood poles outside of fire-hardening areas. There are proactively undergrounding in fire hardening areas. There are some areas that may have had wood changed out to steel in the past but now, based on risk assessment, might move to undergrounding or replacing with covered wire. The undergrounding effort will not have a material impact on the overall account (Installing 880 miles of underground to convert 587 miles of OH). Some portions of the steel poles and areas that has already been hardened that may need to be reworked. The largest focus is on areas with wood poles. Only 10%-15% (estimated) would be reworking semi-hardened areas. In the HFTD, there is 3500 miles of OH and 2500 miles of UG. The total miles in the service territory is 2,500 OH and 3.910 UG. About 140 miles are estimated to be reworked (in addition to the 880 miles). The wood poles being replaced are likely 50+ years old at retirement.

365 – OH Conductor

They would expect OH wire would have a longer life than poles. They have an active reconductoring program and will in some cases, replace conductor when hardening the system. Undergrounding will also affect the life of conductor in the future. They are replacing conductor with covered cable (may increase the life as this becomes more prevalent – not much installed yet.) They are replacing single strand with multi strand steel conductor. Covered conductor is new to the company. Based on engineering analysis and history from other companies, they would expect the covered conductor to last as long as the bare wire. There will be areas that the conductor has been hardened but now will be replaced with covered wire (but not replacing the steel poles). With 10-year plan, expecting over 800 miles of covered conductor to be installed (about 40% could be rework). There will be some early retirements with the rework. No current plans to replace conductor with covered conductor outside of the HFTD area. Current life is 55 years.

366 – UG Conduit

Generally, they have moved away from soil compacted back fill. Now use a slurry mix (since 1970s-1980s) that protects conductor better. Current life is 57 years

367 – UG Cable

They have better connectors than in the past and in the longer term, the materials are better than in the

past. Cable technology has gotten better over time. THE HFTD areas have less costal issues and would have less water issues overall. Current life is 45 years. Analytics show a slightly longer life. Operationally, the life moving longer is reasonable.

368 – Line Transformers

They have better protection and better lightning arrestors than in the past. They have reduced the amount of repairing of old transformers. The newer transformers are more robust as well. When a line is hardened, the transformers and capacitors would also be change out – as well as lightning arresters, fuses, etc. These assets would be changed out in HFTD areas as necessary even if the pole or conductor was not replaced. Current life is 34 years. Analytics show a slightly longer life in the 37-year range. Given better materials and upgrades, slightly longer life makes sense operationally.

368 - Capacitors

They aren't aware of any material changes in this account that would affect the life of capacitors. Some future activities (such as better communication) may shorten the life from a reliability standpoint. Moving from regular to SCADA devices would be a capital replacement. Current life is 12 years which appears to remain unchanged. Like for like replacement of asset is maintenance. Replacement of asset is capital

369 – Services

OH – Would see a parallel between OH primary and services. There are no drivers for a life change. Current life is 55 years. Seems to be holding.

UG – increasing levels of underground is happening. They are installing better hardware that would tend to increase the life. They just updated their cable to a better-quality material. They no longer use paper lead (1920-1960) and will replace when found. They moved to in-conduit (in the early 1960s) services – fewer outages, etc.... Around the time of changing to conduit, they also started using XLPE. Current life of 53 years which is beginning to move out slightly.

370 – Meters

370.10 There are very few electromechanical meters left on the system (mostly opt out). There are proactive measures to replace old meters. There are 2k or 3k opt out meters. They have been moving to solid state meters (non-communicating) for opt out meters. Current life is 48 years. Analytics show a large drop in life. There are no operational reasons that the life of electromechanical meters should be short.

370.11 Electronic – Smart meters – there is an increase in early failures due to internal capacitors failing. There was also a batch 2009-2010 that had manufacturing issues (specific to the displays). The existing infrastructure is only lasting 10-12 years in some cases. Although there are some advanced failures, generally, a 15-year life is still reasonable. They will feed back on whether to move shorter or not. They next deployment may last up to 15 years.

Electric Distribution continued 7/30/21 Attendees for Meters and Installs, Customer Premise and Lab equipment

Meter Installations –

370.2 Meter Installations Old Current life is 48 years. Analytics show a reduction in life similar to 370.10 Meter installations - capitalized when service established. Retired when location goes away. Confusing that life data is showing 15 years.

370.21 Meter Installation Smart Meters For large customers, PTs or CTs could be a part of the account. They would expect as long or longer life for meter installations than for the meter themselves. Current life is 15 years. Analytics show a 15-year life like 370.11

371 –Installations on Customer Premises

They are migrating to LED for this account as current lighting fails. No active program to change from HPS to LED. Current life is 34 years. Seeing a slight reduction in life where there are indications. Operationally the life of about 30 years makes sense. They would expect the life to shorten as bulbs burn out and the heads are retired and replaced with LED (instead of replacing the bulbs under O&M).

8-3-2021

371.1, 373, 393, and 394 have additional feedback

371.10 – EV Charging Stations

Initial thought on life expectancy is 10 years. In the 2019 GRC, there was a study done and requested a 5-year life. The commission moved it to 10 years. The first chargers were put into service in 2017. There have been a few sites where chargers had to be removed (mostly due to lease issues). They have not had any non-warranty failures or repairs in the 4 years they have been in operations. The warranty period is 2-year parts and 1 year service. The only thing in the account is the charger itself – the pedestal mount and integrated charging unit. The communication devices inside the charger may need replacement over the 10-year time frame due to technology changes. They did not install any Level 1 chargers, just newer technology faster chargers. When they must transfer the charger to the customer, the period used in the calculation is between 8 – 10 years (as specified by the Commission).

373 – Street lighting

They are migrating to LED for this account as current lighting fails. Replace on burnout No proactive program to convert from HPS to LED. Current life is 36 years, which currently is in the same range. They would expect the life to shorten in the future as bulbs burn out and the heads are retired and replaced with LED (instead of replacing the bulbs under O&M). Replacing EPS and LPS with LED. Historically, some of the components would fail and be replaced under O&M. With LEDs, they will replace the whole head (which would be a capital item). The current life would still be reasonable at this point.

393 – Stores (Shelving, Racking, only 3 assets)

They may replace due to remodeling. The current 25-year life is still operationally reasonable. They occasionally replace sections of racking for various reasons.

394 – Portable Tools

Common account - 2/3 of the total are ruggedized laptops (MDTs) used in the field. Need more info on the life (23 years is not reasonable for laptops).

Electric – The current life is 27 years. Much of the assets in this account would only have a 5–10-year life with most being closer to a 5-year life (small hand tools, chain saws, cameras, all electronic equipment, ladders, hand and mechanized digging tools, live line tools and rubber goods, hoists, drills, small pumps, winches – 5-year life, fault finding equipment would have a longer life of around 10-15 years, cable/conductor pullers and associated equipment – 10-15 year range, larger pumps – 10-15 years, little generators – 10-15 years. Moving to an overall average of 10 years is operationally supportable.

394 – Shop Equipment

Electric – mostly test equipment – like hot stick testers and glove testers. Includes fault finding Equipment not on truck. Those assets could last longer than 15 years – perhaps 20 to 25 years. Leaving at the current 26-year life seems operationally reasonable. Common – Oil purifier (installed in 1997) is main asset. Consider matching to the electric account life. Should have life similar to lab equipment. 15 years before replacement WE HAVE SLIGHTLY CONFLICTING INFO.

395 – Laboratory Equipment

On the electric metering side, they have electronic equipment that would have a much shorter life than the current 22-year life. They would expect the life for these assets to be between 10 and 15 years. Technology will drive the retirement and replacement of the testing equipment as much as failure. In some cases, there may be a way to replace or upgrade panels without replacing entire units. Manufacturers also stop supporting the equipment at some point. Given both scenarios, moving to a 15-year life is operationally reasonable.

398 – Misc.

7/28/2021 Distribution Substations

361 – Structures

Security system upgrades would have a short life. They are removing all 12kV-4kV stations. They are averaging 1-2 per year in the last few years. Prior to that, they were removing one every 1-2 years. Current life is 63 years. Seeing a slight reduction to 57 years in analytics. Site prep drainage and other assets have similar lives to the current. Security additions are the only new assets in this account.

362 – Station Equipment

They are planning to remove all 12kV - 4 kV substations over the next 10 years (around 10-20 stations out of around 180-200 stations). CBM (Condition Based Monitoring) monitoring is on transformers. Many transformers are older than the 51-year approved life. They would expect transformers to have a 40-60 year life. 30-35 transformers are past the 60-year mark. Breakers are a mix of oil, vacuum, oil and air. Oil breakers are 50 years, vacuum 30, metal clad 30-50 years. If space is available, they would lean toward switchgear. Relays – some electromechanical relays on the system but would replace with solid state when replaced. Solid state -20 years, electromechanical 30-40 years. Ground grids – generally will maintain instead of full replacements. Batteries – 10–20-year life. Capacitor banks are a unit of capital, not individual cans. Seeing a slight increase in life. -

RC – they will look at historical experience to estimate RC. They last updated their inputs 4-5 years ago. Usually update on a 2-year cycle, but process is taking longer this time.

100K to 500-600K to remove a 12-4 kV station (depending on whether brown field or green field).

7/29/2021 Wildfire Mitigation Plan and Aviation

392.30 – Aviation

WNP group has purchased aviation assets for wildfire mitigation. Fairly new activity for the company. They own 1 helicopter (in service in 2018) and two more are planned to be purchased. They have been using helicopters for construction for many years but for fire service, this is new to the company. Drones – 25-30 in service – would have a short life based on the rapid change in technology (maybe 3–4-year life cycle).

WMP

3-year program filed with the PUC. (Office of Energy Infrastructure Information Safety OEIS). Includes grid hardening (including protection from wind). Annual filings of initiative to address wildfire risk, Undergrounding, move away from wood, grid hardening, weather stations, camera, aviation for fire response. Also, weather stations, cameras, Helicopter and drones for inspection and construction. Customer communication efforts. HFTD – High Fire Threat District. Undergrounding in Downtown SD is same work but not included in WMP plan. Tier 3 is the highest focus. Public Safety Shutoff mitigation as well. Cedar fire in 2003 started the enhanced effort. After the 2007 fire, hired weather experts. In 2009, started infrastructure change (began hardening transmission) and later expanded to distribution. Transmission assets were the first area of focus and moved to the Distribution function in 2013-2014. Fire Mitigation Plan was first filed in 2020.

LGBA

Balancing Account for Batteries – set up in order to collect any capital and O&M that is not included in

the GRC. There is depreciation, return, taxes, etc. in the balancing account. There will be further discussion on whether the batteries will move to the GRC or stay in the balancing account.

8-6-2021

375 and 390 (E and C) Structures

They make changes to leased facilities much more frequently than to owned facilities. They have made significant investment over the last several years (a lot of leasehold improvements, system hardening, generators, security work, HVAC, landscaping). Improvements range from \$25k to \$30M. Critical Asset Security Project (CASP) would likely be in the “E” category – with short lives. Any work done in recent years would be charged to account C390. There has not been a lot of structural change to facilities. Over the next few years, there are plans for significant “ground up” projects. This may trigger some retirements (e.g. Kearney). There are many buildings that are well past 40 years old. Generators – 15-25, AC – 15-20, roofs – 20-25 years, security systems 7-10 years (upgrading systems that are that age now), carpet – 10 years. Leasehold improvement has been suspended due to COVID and the environment is changing so a lot of leasehold decisions/changes/improvements will be considered in the future.

391.1 Office furniture

In the early 2000s was the last time they refurbished Century Park and are starting to refresh now. There is also a safety component related to furniture and are moving to more ergonomically friendly designs. The 18 years is reasonable based on experience.

397 Electric

Very technology driven. Life cycles would be less than 10 years (4-7 years would be the expected life cycle). The life should be parallel with 391.2 – computer equipment. Most of the assets are in substations in 397.2 (95%). 397.6 - SWPL has 32% in substations. 397.1 is 22% substation. Substation equipment is manually retired. Most of the assets appear to be shorter lived assets. 30 years appears long. The life should step down – perhaps to 20 years.

PV

Prominent initiatives – they will be installing PV at most company facilities (roof top and ground mount will be changed to Account 344.1).

Renewables/New Technology

FERC 344

Solar assets (FERC Account E344.1 Generators)

Only Solar PV – no concentrated solar. Ramona is the biggest project to date (4 MW). Just started projects that are ground mount (e.g., Cameron Corners). Manufacturers (Canadian Solar) Warranty is 25 years. This is the standard in the industry. A program called Sustainable Communities had a 10-year lease term so 25 years would not be accurate for that project. A lot of the PPAs signed with third parties are 20-25 years agreements. They have examples of where there was not much reusable asset.

At the end of a project, it is likely that the full site would be replaced so setting the 25-year life for all accounts may be reasonable. For interim retirement, assets like inverters may only last 7-10 years. First inverter replacement may be under warranty. Minimum capital threshold is \$10K. Panels would generally be replaced under O&M. The weather station may have some capital replacements, but they would not likely be material (but not in Solar accounts).

Wind assets (FERC Account E344.2 Generators Wind)

The only asset is a vertical wind turbine (Santa Isabell) – believed to be retired. There should be no wind assets on the system. They would put vertical turbines (for a number of reasons) where a 20-year life would still be reasonable.

Fuel Cell (operations is requesting sub account treatment, average life is 10 yrs.)

Have a fuel cell at JD Labs. They are going to overhaul and start a new life of 10 years (parallel to warranty and the LTSA to be signed). There are fuel cells (3-4) at substations – originally put in service around 2018-2019.

FERC 363 Distribution Energy Storage

Battery Energy Storage Systems (BESS), (FERC Account E363.1? Li Ion Batteries Storage)

Some battery projects will reach their end of life at around 10-15 years (Li Ion). The only things booked to this account would be the batteries, inverters, containers, etc. Switchgear, transformers, conduit, etc. would be booked to other accounts. The Tesla time frame is 10 years. Miramar and Fallbrook have 20-year LTSAs. Newer (Iron Phosphate) chemistry would allow less degradation and more cycling. Due to the mix of lives expected for batteries, moving from a 10 year to a 15-year life may make sense. There needs to be more discussion on this one.

Flow Energy Storage Systems, (FERC account E363, average life is 25 years)

Flow Storage batteries would have a 25-year LTSA – would need to look at the contracts. Cameron Corners (Iron Flow) and in the process of purchasing Sumitomo Battery (VRF). Both would likely be consistent with a 25-year life.

Hydrogen Energy Storage Systems at Berago (FERC account E363.3?, sub components differ in lives and function - electrolyzer, tank and fuel cell

3 different assets – electrolyzer, storage tank and fuel cell. (think about water filtration – considered to be a part of the fuel cell, and compressors?) The JD Lab and SoCal fuel cells run off natural gas – do they have the same life expectancy?

Earlier in 2021, this account was specific to Lithium-Ion, now broadened.

Two different types of projects: Palomar (Electrolizer) and Peaker plant (enhanced by using batteries). Would they go to generation?

Fuel cells would have a life expectancy of 10 years. Electrolizers would have a life expectancy of 10 years. Storage may last longer.

Production 8-9-2021

Palomar

588 MW (upgraded recently). CC with cooling tower with inlet chiller 2 7FAs and D11 steam Turbine.

Mixed run time – cycle a lot and some base load. Since 2006 when installed, they have done a number of capital improvements and a number of capital replacements. Installed a gantry crane and bridge crane. Gas fired only. Only in the last few years have changed the process of more capital replacements. 2036 is still the planned retirement date for the plant. They had an LTSA and steam turbine until 2014 (at end of first major). Gas turbines, in 2025 and 2026, they will have to replaced hot gas path hardware. They may refurbish. There could be rotor life span issues that would require rotor replacements. In the next steam turbine outage, there may be some replacements. They are doing capital work on exciters (total replacement) and LCI (partial replacement). They replaced control system a few years ago and don't anticipate any more full replacements (they used an evergreen process – which will still trigger some retirements).

Miramar

In service 2005 for unit 1 and 2009 for second unit. 2 GE LM6000 with NOx water injection, brush generators, emission reductions units. They have upgraded the control system. On the site, they have done a few site upgrades. They have a number of capital replacements over the years. No LTSAs. True peakers. They have black start generators. 2032 retirement date. They would expect the same pattern of interim retirement for Palomar and Miramar.

Cuyamaca (CPAP)

Purchased (2002 initial in service) in 2012. P&W twin packs/swift pace ft8 with twin turbines with one generator. They have black start generators. Upgraded the controls there. 2027 retirement date. They plant does not operate a lot – not wearing out a lot of turbine parts. Stay with SQ curve.

Desert Star

In service May 2000. 2 on 1 501FC+, all three modular hydrogen BB3365 Steam Turbine, HRSG – triple pressure Ericson, Air cooled. It is on leased land. The extension to the lease would take it to March 31, 2027. To extend beyond 2027, they would have to renegotiate with Boulder City. They would have to file with the CPUC to extend beyond 2027. Their turbines are under LTSAs. Just finished a hot gas path, the next would be a Major. Later in 2021, one generator rotors would be replaced. They don't retire an asset unless totally removed. There are no major retirements. SQ would be reasonable. There appears to have been an assumption in the last study that there needed to be a year to remove the site. The current thought is that the lease would allow for removal after the end of the lease and the full 2027 can be used. This needs to be confirmed with Real Estate.

Gas Distribution accounts

One of the components of our system has early retirement. Aldel-A

Integrity Programs

FIMP (Facilities ...) – No current program but are looking at creating a plan similar to SoCal. SoCal Gas input follows. Unlike other IMP programs, there is no underlying regulatory driver. Phased approach to scope the program. Certain pressure vessels, etc are targeted in the early phase. The program is in the early phases. Some replacement of pressure vessels has already taken place, and more is to come. There will be some retirements but not as much as in the SIMP program. In Account 356. Some vessels have not ever been inspected and there may be a short-term set of retirement but then is expected to go back to more. Inspections are visual every 5 years and internal every 10 years. There are a substantial number that will be replaced in the next few years as part of a modernization program. Each equipment type will have its own plans but those are still in flux. Tanks and pressure vessels are similar. Pipe is inspected every 2 years. Typically, they will replace short segments (mostly in storage accounts). Other facility assets that will be in the program are renewable NG, Natural Gas vehicle delivery systems. SDGE has LNG facilities that is not included in SoCal Gas. It's still in the early phases at this point. Given global warming and emissions, combustion-fired compressor lives will shorten. There is a rebuild planned for one station (Moreno Station Transmission – 80% rebuilt) that can't comply with tightening emissions requirements. 3 – 1950s, 4-1970s and 1 1980s will be retired. Two units will remain. This is their only station.

DIMP – Same process as others but started around 2011-2012. There is an active common pipeline replacement program (replacing around 120 miles (30% steel and 70% plastic) SoCal per year 50 miles for SDGE and escalating). Mains, services, meter set. There is a program that can have the effect of increasing the life of the meter sets. SDGE is done with the meter set program, but SoCal is still working on it. Targeting plastic prior to 1986 for SDGE. 1600 miles of Aldel-A (subject to check). SDGE – over 50 miles per year being replaced. Over 15,000 miles of total distribution miles for mains/services for SDGE (steel and plastic).

Gas Meters, Modules, Regulators

AMI Network

SDGE – They use ERTs. They have an elevated failure rate and have an RFP out to replace. Itron Open way 2.4 system. The ERTs talk to the electric collectors. The modules are already showing failure at age 12. They are looking for 15 year or more life for the replacement ERTs. By the time the current generation is replaced, they should be around 15 years.

The current life of meters in the two companies. SDGE 41 years So Cal Gas 25 years They use different testing programs but would come up with the same approach. Historically, meters would have lasted longer. SoCal had 6M meters (all American). SDGE have 3 different manufacturers. They would go after aging meters that were approaching the 30-year life – asking for additional capital in GRCs. When SoCal Gas installed AMI, they would also replace older meters. Closer to 35 years for SDGE would be reasonable operationally with a shorter life of maybe 25 years for SoCal Gas. 2 years ago, SoCal Gas

made a change to their sampling program that will likely extend the life of meters on average. Now, if a meter fails, they will take 2% off the bill for the family until the AMI battery fails. In the future, they may expect to see a slight increase in life as this goes forward. Meters that are not in the residential sampling program, they have to test every 10 years or replace (with a few exceptions for very large meters). Meters that weigh less than 50 lbs., they will take the meter back to the shop. They will totally rebuild generally. They will keep the meters in service. For SDGE, they will repair as well but will expense the repair. Meter costs have escalated. Only two manufacturers in US now.

Acct 382 MSA (Meter Set Assembly) – SDGE do not use pre-manufactured loops for residential. If no overpressure protection on regulator, they will replace. For every 2 meters they replace, they will replace one regulator. Typically, the MSA would not be replaced before the meter (unless customer needed more gas and both would be replaced at the same time), but the MSA is typically not replaced at the same time as a meter but would replace as necessary. Acct SDGE Life 35 years. RC is always charged to O&M. The RC is only charged for regulators.

387 – Tools – Technology improvements (e.g. analog to digital) would shorten the life. They just retired all of their pressure gages and replaced with digital. Communication from the equipment is also a driver to shorten the life. They would expect a life shorter than the current 16 years. Closer to the life of computers. 10 years would be more reasonable for a subset of the account. There may be a lag in retiring assets in this account. The large balance is Gas Energy Measurement System which is from 2008.

SDGE 28-year life for account 385. They have always used premanufactured loops. Industrial stations lives would likely be less than that of M&R stations in 378 due to being governed by the business using the station.

375 – There are no obvious change in the usage or characteristics of these assets that would suggest a material change in life. There are a number of shorter life assets within the group – roofs, HVAC, Generators, parking lot replacements, etc. that would moderate the building lives. Life of those assets will be shorter since those buildings do not have more robust systems like general office. All other distribution buildings are booked in 375.

Gas Distribution - SDGE

Mains – Integrity Program is targeting plastic prior to 1986 for SDGE. 1600 miles of Aldel-A (subject to check). SDGE – over 50 miles per year being replaced. Over 15,000 miles of total distribution miles for mains/services for SDGE (steel and plastic). Integrity management program which is replacing early vintage plastic (pre-1973 and 1973 -1985) for both mains and services. There are 3 separate steel programs (pre-33, 34-65 and 65 and over) that are not part of DIMP. There is only 150 miles left in the system of pre-33 pipe. Most of the SDGE system is from later than the 1950s with the “boom” in the 1970s and 1980s (i.e. when most pipe was added). The steel programs didn’t kick off until late 2019 and ramped up in 2020. Some of the older steel pipe that is CP protected that are being focused on but are not part of DIMP. It’s been around for a while and has escalated over the last few years. RAMP is also increasing funding to be able to replace more pipe. This is in addition to normal replacements. The

planned replacement programs that are ranked by risk would signal that the pipe will be replaced sooner than in the past. They would have expected the life to decrease with the level of retirements that are occurring. The average life of 88 years shown in the analysis is vastly longer than the expectations from the SMEs – most replacements are closer to a 70-year life.

Services – The service rises above the ground for a portion of its length. That portion is vulnerable to weed eaters, fertilizer, dig-ins by customers, houses abandoned, etc. It is more likely that they would change services than mains. If the main is Aldel-A, they would normally replace the service. If cut, they would generally repair the service. If a service has had a leak in the past, they would likely replace. If a steel main is replaced with plastic, the service would be replaced if steel. They would expect the life of services to have a slightly shorter live than mains – many factors that would retire a service earlier. The higher focus on not stranding steel services would also be a factor in shortening the life of services. The average life of 97 years shown in the analysis is vastly longer than the expectations from the SMEs – most replacements are closer to a 50-60-year life.

M&R Station equipment – In the last rate case, a study was done for M&R stations. 5 years ago, 70% of reg stations were 24 years or older (maybe 30 years now). There are around 500 stations. Other programs can affect the replacement of stations. Stations would retire based on capacity, the type of equipment (outdated), in an unsafe area, etc. There is a parts and inspection program that can extend the life. Some older stations will have components that are not easy to replacements and would replace the entire station instead of replacing the regulator. The older components were from the 1950s, 1960s or 1970s. Higher risk reg stations are being target for replacement. The regulations for Reg stations have changed more than the regulations for mains and services. They have been upgrading stations. They are also more aggressively targeting reg stations that they have in the past. Operationally, there is no reason that the life should increase. There are drivers that would decrease the life. E.g., RAMP and Control Center Modernization programs.

LGBA – Battery Storage Balancing Account 8-12-2021

The discussion relates to how to recover removal cost while in a balancing account. The balancing account uses the approved depreciation rate (which did not have RC) at the time of the preliminary statement filing for the balancing account. The preliminary statement can't be changed. It would be acceptable if the LGBA can move to Distribution in the GRC. PG&E already has Batteries in 363. A little more research is appropriate, but the best path is to move this into the GRC.

Misc. Gas Assets (Continued) 8-13-2021

LNG Account (363.6)

SDGE owns a small facility. Installed in 1956. Tanks and vaporizers are original equipment. Cryogenic components, alarms/controls and valves have been replaced. The alarms/controls etc. would have a 10–15-year life. A couple small cryogenic tanks. Storage and vaporization equipment. Berago. There was an upgrade to the system a couple years ago. Much of the cost is alarms and instrumentation. The

life would be somewhere around that of CNG. 20 years for an average is reasonable.

CNG Equipment (387.12)

Compressors, pipes, fire protection, infrastructure, etc. CNG Vehicle fueling stations. They have 5 stations. 3 have been refurbished in the last couple years. The first were installed in the 1990s. Most have been retired. Of the 5 left, 2014 and 2017 were the latest two installed. Moving out to 20 years (to match SoCal Gas) would be reasonable.

Shop Equipment (394.2)

Boring Machine and cabinet in the machine shop are largest assets for gas. They have upgraded many of their shop assets in recent years (CNC instead of manual). A decrease in life for the newer electronic equipment would be reasonable.

Communication Equipment (397.00)

Electronic pressure monitoring equipment and AMI/SCADA electronics. 15 years is operationally reasonable.

Misc Equipment (398.11)

2016 is \$335k fusion equipment. All is equipment used for training purposes. If the equipment was in the field, the life might be 10 years or less. It would last a little longer in training. Operationally, 15 years would be a more reasonable life.

PHMSA Mega Rule recommends capitalization of the testing, etc. of the older pipe. The company will start capitalizing those costs in a separate sub account. We need to set a depreciation rate for those capital costs – likely, we will base the rate on the remaining life of the underlying pipe with no net salvage.

Removal Cost Discussion 8-19-2021

List is being prepared to show removal cost for projects where retirements have not been processed. There are over 450 gas distribution back log projects. There are few retirements related to the program replacements. There will be further research on whether there are disconnects within operations on declaring projects in service. Company will match the RC for known back log projects with FERC accounts and pursue the potential disconnect with operations.

Aviation:

Helicopters: we do a lease versus buy decision. If we're going to keep it for longer 7 years, it's cheaper to buy it

The one we own is the least expensive to operate

We've had it three years, we estimate we'll put another 20 years on it at least, following strict maintenance, engine warranties, required to replace certain items at certain times

*will look into salvage value

Level of use of helicopter is going up, but not where Tom thinks it would affect the life

Drones: every 2 years move to newer drones because technology keeps changing, cameras get really good; probably more

The three helicopters owned, or planned to be owned by SDG&E, and their current status with us are:

- 2017 Airbus H145: fully paid for, currently operating with us
- 2020 Sikorsky Blackhawk, configured as a Firehawk: at first payment only, next payment is final payment for Sikorsky with delivery to us and transfer to configuration company (United Rotorcraft). Final delivery to us will be in late 2022/early 2023
- 2021 Bell 412 EPX: in negotiations with Bell. No contract, yet. If on contract this year, earliest delivery would be early to mid-2023

Batteries 11-10-2021

Discuss moving batteries to GRC from LGBA.

The study should include all assets (no matter what the recovery mechanism is).

Account 344.2 Generators – Other

50/50 Microgrid generators and large Portable Generators

Leave at 20 years with an R1 dispersion

Structure counts are based on location of structures, not actual number of structures at given location.

For example, location (thus count) may have 1 pole, whereas out in the field there are 2 physical poles. This does not happen frequently.
